Criação de regras AWS Config gerenciadas com AWS CloudFormation modelos

> **Important**
>
> Você deve primeiro criar e iniciar o gravador de AWS Config configuração para criar regras AWS Config gerenciadas com AWS CloudFormation. Para obter mais informações, consulte Gerenciar o gravador de configuração.

Para regras AWS Config gerenciadas compatíveis, você pode usar os CloudFormation modelos para criar a regra para sua conta ou atualizar uma CloudFormation pilha existente. Uma pilha do é um conjunto de recursos relacionados que você provisiona e atualiza como uma unidade. Quando você

executa uma pilha com um modelo, a regra gerenciada AWS Config é criada para você. Os modelos criam somente a regra e não criam AWS recursos adicionais.

> **Note**
>
> Quando as regras AWS Config gerenciadas são atualizadas, os modelos são atualizados para as alterações mais recentes. Para salvar uma versão específica de um modelo para uma regra, faça download do modelo e faça upload dele para o seu bucket do S3.

Para obter mais informações sobre como trabalhar com AWS CloudFormation modelos, consulte Introdução ao Guia do AWS CloudFormation usuário. AWS CloudFormation

Para iniciar uma CloudFormation pilha para uma regra AWS Config gerenciada

1. Vá até o CloudFormationconsole e crie uma nova pilha.
2. Para Specify template (Especificar modelo):
   - Se tiver feito download do modelo, selecione Upload a template file (Fazer upload de um arquivo de modelo) e Choose file (Escolher arquivo) para fazer upload do modelo.
   - Você também pode escolher a URL do Amazon S3 e inserir a URL `http://s3.amazonaws.com/aws-configservice-us-east-1/cloudformation-templates-for-managed-rules/`*`THE_RULE_IDENTIFIER`*`.template` do modelo.

   > **Note**
   >
   > O identificador da regra deve ser escrito em ALL_CAPS_WITH_UNDERSCORES. Por exemplo, CLOUDWATCH_LOG_GROUP_ENCRYPTED em vez de. cloudwatch-log-group-encrypted
   > Para algumas regras, o identificador da regra é diferente do nome da regra. Use o identificador da regra. Por exemplo, o identificador de regra para ssh restrito é INCOMING_SSH_DISABLED.

3. Escolha Próximo.
4. Em Especificar detalhes da pilha, digite o nome da pilha e insira os valores dos parâmetros para a AWS Config regra. Por exemplo, se estiver usando o modelo de regra gerenciada `DESIRED_INSTANCE_TYPE`, você pode especificar o tipo de instância; por exemplo, "m4.large".

5. Escolha Próximo.
6. Em Options (Opções), você pode criar tags ou configurar outras opções avançadas. Elas não são obrigatórias.
7. Escolha Próximo.
8. Em Review (Revisar), verifique se o modelo, os parâmetros e as outras opções estão corretas.
9. Escolha Criar. A pilha é criada em alguns minutos. Você pode visualizar a regra criada no console do AWS Config.

Você pode usar os modelos para criar uma única pilha para regras AWS Config gerenciadas ou atualizar uma pilha existente em sua conta. Se você excluir uma pilha, as regras gerenciadas criadas a partir dessa pilha também serão excluídas. Para obter mais informações, consulte Trabalhar com pilhas no Guia do usuário do AWS CloudFormation .

AWS Config Regras personalizadas

AWS Config Regras personalizadas são regras que você cria do zero. Há duas maneiras de criar regras AWS Config personalizadas: com as funções Lambda (Guia do AWS Lambda desenvolvedor) e com o Guard (Guard GitHub Repository), uma linguagem. policy-as-code

AWS Config as regras personalizadas criadas com o Lambda são chamadas de Regras AWS Config Lambda AWS Config Personalizadas e as regras personalizadas criadas com o Guard são chamadas AWS Config de Regras de Política Personalizadas.

Antes de usar regras personalizadas, consulte Considerações.

AWS Config Regras de política personalizadas

As regras escritas usando o Guard podem ser criadas no AWS Config console ou usando a AWS Config regra APIs. AWS Config As regras de políticas personalizadas permitem que você crie regras AWS Config personalizadas sem precisar usar Java ou Python para desenvolver funções do Lambda e gerenciar suas regras personalizadas. AWS Config As regras de política personalizada são iniciadas por alterações de configuração. Para obter mais informações sobre o Guard, consulte o GitHubRepositório Guard.

AWS Config Regras personalizadas do Lambda

As regras personalizadas do Lambda oferecem a opção de usar Java ou Python para criar uma função do Lambda para uma regra personalizada. AWS Config Uma função Lambda é um código

personalizado para AWS Lambda o qual você carrega e é invocado por eventos que são publicados nela por uma fonte de eventos. Se a função Lambda estiver associada a uma AWS Config regra, ela será AWS Config invocada quando a regra for iniciada. Em seguida, a função Lambda avalia as informações de configuração enviadas por AWS Config e retorna os resultados da avaliação. Para mais informações sobre as funções do Lambda, consulte Origens de eventos e funções no Guia do desenvolvedor do AWS Lambda .

Diferenças de formato para regras AWS Config personalizadas

A tabela a seguir mostra as diferenças de formato nos campos do tipo de ConfigurationItemdados e das Regras AWS Config Personalizadas.

ConfigurationItem	AWS Config Regra personalizada
`version`	`configurationItemVersion`
`accountId`	`awsAccountId`
`arn`	`ARN`
`configurationItemMD5Hash`	`configurationStateMd5Hash`

Criação AWS Config de regras de política personalizadas

Você pode criar regras de política AWS Config personalizada a partir da AWS Config API Console de gerenciamento da AWS AWS CLI, ou.

Adicionando regras de política AWS Config personalizadas

Using the console

1. Faça login no Console de gerenciamento da AWS e abra o AWS Config console em https://console.aws.amazon.com/config/casa.

2. No Console de gerenciamento da AWS menu, verifique se o seletor de região está definido como uma AWS região que ofereça suporte a AWS Config regras. Para obter a lista das regiões compatíveis, consulte Regiões e endpoints do AWS Config no Referência geral da Amazon Web Services.
3. Na barra de navegação à esquerda, selecione Rules (Regras).
4. Na página Rules (Regras), selecione Add rule (Adicionar regra).
5. Na página Especificar tipo de regra, escolha Criar regra personalizada usando o Guard.
6. Na página Configurar regra, configure a regra através das seguintes etapas:
   a. Para Nome, digite um nome exclusivo para a regra.
   b. Em Descrição, digite uma descrição para a regra.
   c. Para a versão de tempo de execução do Guard, escolha o sistema de tempo de execução para sua regra de política AWS Config personalizada.
   d. Para o Conteúdo da regra, você pode preenchê-lo com a política personalizada do Guard para sua regra.
   e. No Modo de avaliação, escolha quando, no processo de criação e gerenciamento de recursos, você AWS Config deseja avaliar seus recursos. Dependendo da regra, AWS Config você pode avaliar suas configurações de recursos antes que um recurso tenha sido provisionado, depois de um recurso ter sido provisionado, ou ambos.
      i. Escolha Ativar a avaliação proativa para permitir que você execute avaliações nas configurações de seus recursos antes de serem implantados.

         Depois de ativar a avaliação proativa, você pode usar a StartResourceEvaluationAPI e a GetResourceEvaluationSummaryAPI para verificar se os recursos especificados nesses comandos seriam sinalizados como NÃO COMPATÍVEIS pelas regras proativas da sua conta na sua região.

         Para obter mais informações sobre como usar esses comandos, consulte Avaliando seus recursos com AWS Config regras. Para obter uma lista de regras gerenciadas que oferecem suporte à avaliação proativa, consulte Lista de regras AWS Config gerenciadas por modo de avaliação.
      ii. Escolha Ativar a avaliação de detecção para avaliar as definições de configuração de seus recursos existentes.

Para avaliação de detetives, as regras de política AWS Config personalizada são iniciadas pelas alterações de configuração. Essa opção será pré-selecionada.

- Recursos: quando um recurso que corresponde ao tipo de recurso especificado, ou ao tipo mais identificador, é criado, alterado ou excluído.
- Tags: quando um recurso com a tag especificada é criado, alterado ou excluído.
- Todas as alterações — Quando um recurso registrado por AWS Config é criado, alterado ou excluído.

AWS Config executa a avaliação quando detecta uma alteração em um recurso que corresponda ao escopo da regra. Você pode usar o escopo para restringir quais recursos iniciam as avaliações. Caso contrário, as avaliações serão iniciadas quando houver uma alteração em um recurso pós-provisionado.

f. Para Parâmetros, você poderá personalizar os valores das chaves fornecidas, se sua regra incluir parâmetros. Um parâmetro é um atributo que seus recursos devem ter antes de serem considerados compatíveis com a regra.

7. Na página Revisar e criar, revise todas as suas seleções antes de adicionar a regra à sua Conta da AWS.
8. Ao terminar de revisar suas regras, escolha Adicionar regra.

Using the AWS CLI

Use o comando `put-config-rule`.

O campo `Owner` deveria ser `CUSTOM_POLICY`. Os seguintes campos adicionais são obrigatórios para regras de política AWS Config personalizada:

- `Runtime`: o sistema de tempo de execução para suas regras de política AWS Config personalizada.
- `PolicyText`: a definição da política que contém a lógica para suas regras de política personalizadas do AWS Config .
- `EnableDebugLogDelivery`: a expressão booleana para ativar o registro de depuração para sua regra de política AWS Config personalizada. O valor padrão é `false`.

Using the API Reference

Use a ação PutConfigRule.

O campo `Owner` deveria ser `CUSTOM_POLICY`. Os seguintes campos adicionais são obrigatórios para regras de política AWS Config personalizada:

- `Runtime`: o sistema de tempo de execução para suas regras de política AWS Config personalizada.
- `PolicyText`: a definição da política que contém a lógica para suas regras de política personalizadas do AWS Config .
- `EnableDebugLogDelivery`: a expressão booleana para ativar o registro de depuração para sua regra de política AWS Config personalizada. O valor padrão é `false`.

Escrevendo conteúdo de regras para regras de política AWS Config personalizada

Com as regras de política AWS Config personalizada, você pode usar a linguagem específica de domínio (DSL) do AWS CloudFormation Guard para avaliar as configurações de recursos. Este tópico apresenta padrões e práticas recomendadas para criar regras de política personalizadas.

Para obter mais informações sobre como escrever regras com o Guard, consulte Escrevendo regras do Guard no Guia do usuário do AWS CloudFormation AWS CloudFormation Guard e Modos de operação do Guard 2.0 no GitHub repositório do Guard.

Estrutura básica de regras

Use o seguinte formato básico para criar regras:

```
# Basic rule format
rule <rule_name> when
    resourceType == "<AWS::Service::Resource>" {
    # Evaluation clauses
}

# Example with filtering
let resources_of_type = Resources.*[ Type == 'AWS::Service::Resource' ]
rule check_resources when %resources_of_type !empty {
    %resources_of_type.configuration.property == expected_value
}
```

Componentes principais

configuration

Contém o conteúdo para a configuração do recurso.

supplementaryConfiguration

Contém conteúdo adicional para a configuração do recurso. AWS Config retorna esse campo para determinados tipos de recursos para complementar as informações retornadas para o campo de configuração.

resourceType

AWS tipo de recurso que está sendo avaliado.

resourceId

A do recurso (por exemplo, `sg-xxxxxx`).

accountId

O Conta da AWS ID de 12 dígitos associado ao recurso.

Padrões comuns

Status checks

```
let allowed_status = ['ACTIVE', 'RUNNING']
rule check_resource_status when
    resourceType == "AWS::Service::Resource" {
    configuration.status IN %allowed_status
}
```

Required properties

```
rule check_required_properties when
    resourceType == "AWS::Service::Resource" {
    configuration.propertyName exists
    configuration.propertyName is_string  # or is_list, is_struct
}
```

Query blocks

```
configuration.Properties {
```

```
    property1 exists
    property2 is_string
    property3 IN [allowed_value1, allowed_value2]
}
```

Conditional evaluation

```
when configuration.feature_enabled == true {
    configuration.feature_settings exists
    configuration.feature_settings is_struct
}
```

Custom messages

```
rule check_compliance when
    resourceType == "AWS::Service::Resource" {
    configuration.property == expected_value <<Custom error message explaining the
 requirement>>
}}
```

Recursos avançados

Range checks

```
rule check_numeric_limits {
    # Inclusive range (lower_limit <= value <= upper_limit)
    configuration.value IN r[minimum_value, maximum_value]

    # Exclusive range (lower_limit < value < upper_limit)
    configuration.value IN r(exclusive_min, exclusive_max)

    # Left inclusive, right exclusive (lower_limit <= value < upper_limit)
    configuration.value IN r[minimum_value, exclusive_max)

    # Left exclusive, right inclusive (lower_limit < value <= upper_limit)
    configuration.value IN r(exclusive_min, maximum_value]
}
```

Combining conditions

```
# AND conditions (implicit through new lines)
```

```
condition_1
condition_2

# OR conditions (explicit)
condition_3 OR
condition_4
```

Chaining rules

```
rule check_prerequisites {
    configuration.required_setting exists
}

rule check_details when check_prerequisites {
    configuration.required_setting == expected_value
}
```

Práticas recomendadas

- Use variáveis com instruções `let` para melhorar a legibilidade.
- Agrupe as verificações relacionadas usando blocos de regras nomeados.
- Inclua comentários descritivos.
- Use operadores apropriados (`exists`, `is_string`, `is_list`).
- Use padrões de regex com a correspondência que não diferencia maiúsculas de minúsculas.

Exemplo: dynamodb-pitr-enabled.

O exemplo a seguir mostra a definição da política para uma versão da regra de política AWS Config personalizada da regra AWS Config gerenciadadynamodb-pitr-enabled. Essa regra verifica se as tabelas Point-in-Time do DynamoDB têm a Recuperação ativada.

```
# Check if DynamoDB tables have Point-in-Time Recovery enabled
let status = ['ACTIVE']

rule tableisactive when
    resourceType == "AWS::DynamoDB::Table" {
    configuration.tableStatus == %status
```

```
}

rule checkcompliance when
    resourceType == "AWS::DynamoDB::Table"
    tableisactive {
    let pitr =
 supplementaryConfiguration.ContinuousBackupsDescription.pointInTimeRecoveryDescription.pointIn
    %pitr == "ENABLED" <<DynamoDB tables must have Point-in-Time Recovery enabled>>
}
```

Criação de AWS Config regras personalizadas do Lambda

Você pode desenvolver regras personalizadas e adicioná-las AWS Config com AWS Lambda funções.

Você associa cada regra personalizada a uma função Lambda, que contém a lógica que avalia se seus AWS recursos estão em conformidade com a regra. Você associa essa função com a sua regra, e a regra chama a função em resposta a alterações de configuração ou periodicamente. Em seguida, a função avalia se seus recursos estão em conformidade com sua regra e envia os resultados da avaliação para AWS Config.

AWS Kit de desenvolvimento de regras (RDK)

O AWS Rule Development Kit (RDK) foi projetado para oferecer suporte a um fluxo de trabalho de “conformidade como código” que seja intuitivo e produtivo. Ele elimina grande parte do trabalho pesado indiferenciado associado à implantação de AWS Config regras apoiadas por funções personalizadas do Lambda e fornece um processo iterativo simplificado. develop-deploy-monitor

Para obter step-by-step instruções, consulte a documentação do AWS Rule Development Kit (RDK).

Exemplo de AWS Lambda funções para AWS Config regras (Node.js)

AWS Lambda executa funções em resposta a eventos publicados pelos AWS serviços. A função de uma regra AWS Config personalizada do Lambda recebe um evento publicado por e AWS Config, em seguida, usa os dados que recebe do evento e recupera da AWS Config API para avaliar a conformidade da regra. As operações em uma função para uma regra Config diferem conforme a avaliação seja acionada por alterações de configuração ou acionada periodicamente.

Para obter informações sobre padrões comuns nas AWS Lambda funções, consulte Modelo de programação no Guia do AWS Lambda desenvolvedor.

Example Function for Evaluations Triggered by Configuration Changes

AWS Config invocará uma função como o exemplo a seguir ao detectar uma alteração na configuração de um recurso que esteja dentro do escopo de uma regra personalizada.

Se você usar o AWS Config console para criar uma regra associada a uma função como este exemplo, escolha Alterações de configuração como o tipo de acionador. Se você usar a AWS Config API ou AWS CLI criar a regra, defina o `MessageType` atributo `ConfigurationItemChangeNotification` como `OversizedConfigurationItemChangeNotification` e. Essas configurações permitem que sua regra seja acionada sempre que AWS Config gerar um item de configuração ou um item de configuração superdimensionado como resultado de uma alteração de recurso.

Este exemplo avalia seus recursos e verifica se as instâncias correspondem ao tipo de recurso `AWS::EC2::Instance`. A regra é acionada quando o AWS Config gera um item de configuração ou uma notificação de item de configuração superdimensionado.

```
'use strict';

import { ConfigServiceClient, GetResourceConfigHistoryCommand,
 PutEvaluationsCommand } from "@aws-sdk/client-config-service";

const configClient = new ConfigServiceClient({});

// Helper function used to validate input
function checkDefined(reference, referenceName) {
    if (!reference) {
        throw new Error(`Error: ${referenceName} is not defined`);
    }
    return reference;
}

// Check whether the message type is OversizedConfigurationItemChangeNotification,
function isOverSizedChangeNotification(messageType) {
    checkDefined(messageType, 'messageType');
    return messageType === 'OversizedConfigurationItemChangeNotification';
}

// Get the configurationItem for the resource using the getResourceConfigHistory
 API.
async function getConfiguration(resourceType, resourceId, configurationCaptureTime,
 callback) {
```

```
    const input = { resourceType, resourceId, laterTime: new
 Date(configurationCaptureTime), limit: 1 };
    const command = new GetResourceConfigHistoryCommand(input);
    await configClient.send(command).then(
        (data) => {
            callback(null, data.configurationItems[0]);
        },
        (error) => {
            callback(error, null);
        }
    );

}

// Convert the oversized configuration item from the API model to the original

function convertApiConfiguration(apiConfiguration) {
    apiConfiguration.awsAccountId = apiConfiguration.accountId;
    apiConfiguration.ARN = apiConfiguration.arn;
    apiConfiguration.configurationStateMd5Hash =
 apiConfiguration.configurationItemMD5Hash;
    apiConfiguration.configurationItemVersion = apiConfiguration.version;

        }
    }
    return apiConfiguration;
}

// Based on the message type, get the configuration item either from the

Operações de função

A função executa as seguintes operações em tempo de execução:

1. A função é executada quando AWS Lambda passa o `event` objeto para a `handler` função. Neste exemplo, a função aceita o `callback` parâmetro opcional, que ela usa para retornar informações ao chamador. AWS Lambda também passa um `context` objeto, que contém informações e métodos que a função pode usar enquanto é executada. Observe que nas versões mais recentes do Lambda, o contexto não é mais usado.
2. A função verifica se `messageType` para o evento é um item de configuração ou um item de configuração superdimensionado, e, em seguida, retorna o item de configuração.
3. O handler chama a função `isApplicable` para determinar se o recurso foi excluído.

   > **Note**
   >
   > Os relatórios de regras sobre recursos excluídos devem retornar o resultado da avaliação de `NOT_APPLICABLE`, a fim de evitar avaliações desnecessárias de regras.

4. O manipulador chama a `evaluateChangeNotificationCompliance` função e passa os `ruleParameters` objetos `configurationItem` e AWS Config publicados no evento.

   A função primeiro avalia se o recurso é uma instância EC2. Se o recurso não é uma instância EC2, a função retorna um valor de compatibilidade de `NOT_APPLICABLE`.

   Em seguida, a função avalia se o atributo `instanceType` no item de configuração é igual ao valor de parâmetro `desiredInstanceType`. Se os valores são iguais, a função retornará `COMPLIANT`. Se os valores não são iguais, a função retornará `NON_COMPLIANT`.
5. O manipulador se prepara para enviar os resultados da avaliação AWS Config inicializando o objeto. `putEvaluationsRequest` Este objeto inclui o parâmetro `Evaluations`, que identifica o resultado de compatibilidade, o tipo de recurso e o ID do recurso que foi avaliado. O `putEvaluationsRequest` objeto também inclui o token de resultado do evento, que identifica a regra e o evento para AWS Config.
6. O manipulador envia os resultados da avaliação AWS Config passando o objeto para o `putEvaluations` método do `config` cliente.

Operações de função

1. A função é executada quando AWS Lambda passa o `event` objeto para a `handler` função. Neste exemplo, a função aceita o `callback` parâmetro opcional, que ela usa para retornar informações ao chamador. AWS Lambda também passa um `context` objeto, que contém informações e métodos que a função pode usar enquanto é executada. Observe que nas versões mais recentes do Lambda, o contexto não é mais usado.
2. Para contar os recursos do tipo especificado, o handler chama a função `countResourceTypes` e passa o parâmetro `applicableResourceType` que recebeu do evento. A função `countResourceTypes` chama o método `listDiscoveredResources` do cliente `config`, que retorna uma lista de identificadores para os recursos aplicáveis. A função usa o comprimento da lista para determinar o número de recursos aplicáveis e retorna essa contagem para o handler.
3. O manipulador se prepara para enviar os resultados da avaliação AWS Config inicializando o objeto. `putEvaluationsRequest` Esse objeto inclui o `Evaluations` parâmetro, que identifica o resultado da conformidade e o Conta da AWS que foi publicado no evento. Você pode usar o parâmetro `Evaluations` para aplicar o resultado a qualquer tipo de recurso que tenha suporte no AWS Config. O `putEvaluationsRequest` objeto também inclui o token de resultado do evento, que identifica a regra e o evento para AWS Config.
4. Dentro do objeto `putEvaluationsRequest`, o handler chama a função `evaluateCompliance`. Esta função testa se o número de recursos aplicáveis excede o máximo atribuído ao parâmetro `maxCount`, que foi fornecido pelo evento. Se o número de recursos excede o máximo, a função retorna `NON_COMPLIANT`. Se o número de recursos não excede o máximo, a função retorna `COMPLIANT`.
5. O manipulador envia os resultados da avaliação AWS Config passando o objeto para o `putEvaluations` método do `config` cliente.

Exemplos de AWS Lambda funções para AWS Config regras (Python)

AWS Lambda executa funções em resposta a eventos publicados pelos AWS serviços. A função de uma regra AWS Config personalizada do Lambda recebe um evento publicado por e AWS Config, em seguida, usa os dados que recebe do evento e recupera da AWS Config API para avaliar a conformidade da regra. As operações em uma função para uma regra Config diferem conforme a avaliação seja acionada por alterações de configuração ou acionada periodicamente.

Para obter informações sobre padrões comuns nas AWS Lambda funções, consulte Modelo de programação no Guia do AWS Lambda desenvolvedor.

Example Function for Evaluations Triggered by Configuration Changes

AWS Config invocará uma função como o exemplo a seguir ao detectar uma alteração na configuração de um recurso que esteja dentro do escopo de uma regra personalizada.

Se você usar o AWS Config console para criar uma regra associada a uma função como este exemplo, escolha Alterações de configuração como o tipo de acionador. Se você usar a AWS Config API ou AWS CLI criar a regra, defina o `MessageType` atributo `ConfigurationItemChangeNotification` como `OversizedConfigurationItemChangeNotification` e. Essas configurações permitem que sua regra seja acionada sempre que AWS Config gerar um item de configuração ou um item de configuração superdimensionado como resultado de uma alteração de recurso.

Operações de função

A função executa as seguintes operações em tempo de execução:

1. A função é executada quando AWS Lambda passa o `event` objeto para a `handler` função. Neste exemplo, a função aceita o `callback` parâmetro opcional, que ela usa para retornar informações ao chamador. AWS Lambda também passa um `context` objeto, que contém informações e métodos que a função pode usar enquanto é executada. Observe que nas versões mais recentes do Lambda, o contexto não é mais usado.
2. Para contar os recursos do tipo especificado, o handler chama a função `countResourceTypes` e passa o parâmetro `applicableResourceType` que recebeu do evento. A função `countResourceTypes` chama o método `listDiscoveredResources` do cliente `config`, que retorna uma lista de identificadores para os recursos aplicáveis. A função usa o comprimento da lista para determinar o número de recursos aplicáveis e retorna essa contagem para o handler.
3. O manipulador se prepara para enviar os resultados da avaliação AWS Config inicializando o objeto. `putEvaluationsRequest` Esse objeto inclui o `Evaluations` parâmetro, que identifica o resultado da conformidade e o Conta da AWS que foi publicado no evento. Você pode usar o parâmetro `Evaluations` para aplicar o resultado a qualquer tipo de recurso que tenha suporte no AWS Config. O `putEvaluationsRequest` objeto também inclui o token de resultado do evento, que identifica a regra e o evento para AWS Config.
4. Dentro do objeto `putEvaluationsRequest`, o handler chama a função `evaluateCompliance`. Esta função testa se o número de recursos aplicáveis excede o máximo atribuído ao parâmetro `maxCount`, que foi fornecido pelo evento. Se o número de recursos excede o máximo, a função retorna `NON_COMPLIANT`. Se o número de recursos não excede o máximo, a função retorna `COMPLIANT`.
5. O manipulador envia os resultados da avaliação AWS Config passando o objeto para o `putEvaluations` método do `config` cliente.

Exemplos de eventos para AWS Config regras

Quando o acionador de uma regra ocorre, AWS Config invoca a AWS Lambda função da regra publicando um evento. Em seguida, AWS Lambda executa a função passando o evento para o manipulador da função.

Example Event for Evaluations Triggered by Configuration Changes

AWS Config publica um evento quando detecta uma alteração na configuração de um recurso que está dentro do escopo de uma regra. O evento de exemplo a seguir mostra que a regra foi acionada por uma alteração de configuração para uma instância EC2.

```

Example Event for Evaluations Triggered by Periodic Frequency

AWS Config publica um evento quando avalia seus recursos na frequência especificada por você (como a cada 24 horas). O evento de exemplo a seguir mostra que a regra foi acionada por uma frequência periódica.

```
{
    "invokingEvent": "{\"awsAccountId\":\"123456789012\",\"notificationCreationTime

}
```

Atributos do evento

O objeto JSON de um AWS Config evento contém os seguintes atributos:

`invokingEvent`

O evento que aciona a avaliação de uma regra. Se o evento é publicado em resposta a uma alteração de configuração de recursos, o valor para esse atributo é uma string que contém um arquivo JSON `configurationItem` ou um `configurationItemSummary` (para itens de configuração superdimensionados). O item de configuração representa o estado do recurso no momento em que AWS Config detectou a alteração. Para obter um exemplo de um item de configuração, consulte a saída produzida pelo `get-resource-config-history` AWS CLI comando emVisualizar o histórico de configuração.

Se o evento é publicado para uma avaliação periódica, o valor é uma string que contém um objeto JSON. O objeto inclui informações sobre a avaliação que foi acionada.

Para cada tipo de evento, uma função deve analisar a string com um analisador JSON para ser capaz de avaliar seu conteúdo, como mostrado no seguinte exemplo de Node.js:

```
var invokingEvent = JSON.parse(event.invokingEvent);
```

`ruleParameters`

Os pares de chave/valor que a função processa como parte de sua avaliação lógica. Você define parâmetros ao usar o AWS Config console para criar uma regra personalizada do Lambda. Você também pode definir parâmetros com o `InputParameters` atributo na solicitação `PutConfigRule` AWS Config da API ou no `put-config-rule` AWS CLI comando.

O código JSON para os parâmetros está contido em uma string, de modo que uma função deve analisar a string com um analisador JSON para ser capaz de avaliar seu conteúdo, como mostrado no seguinte exemplo de Node.js:

```
var ruleParameters = JSON.parse(event.ruleParameters);
```

`resultToken`

Um token para o qual a função deve passar AWS Config com a `PutEvaluations` chamada.

`eventLeftScope`

Um valor booleano que indica se o AWS recurso a ser avaliado foi removido do escopo da regra. Se o valor for `true`, a função indica que a avaliação pode ser ignorada especificando-se `NOT_APPLICABLE` como o valor para o atributo `ComplianceType` na chamada `PutEvaluations`.

`executionRoleArn`

O ARN da função do IAM atribuída a. AWS Config

`configRuleArn`

O ARN AWS Config atribuído à regra.

`configRuleName`

O nome que você atribuiu à regra que causou AWS Config a publicação do evento e a invocação da função.

`configRuleId`

O ID AWS Config atribuído à regra.

`accountId`

O ID do Conta da AWS proprietário da regra.

`version`

Um número de versão atribuído por AWS. A versão será incrementada se AWS adicionar atributos aos AWS Config eventos. Se uma função requer um atributo que está somente em eventos que correspondem ou excedem uma versão específica, essa função pode verificar o valor desse atributo.

A versão atual para AWS Config eventos é 1.0.

Gerenciando recursos excluídos para regras AWS Config personalizadas do Lambda

Os relatórios de regras sobre recursos excluídos devem retornar o resultado da avaliação de `NOT_APPLICABLE`, a fim de evitar avaliações desnecessárias de regras.

Quando você exclui um recurso, AWS Config cria um `configurationItem` com `ResourceDeleted` para `configurationItemStatus` o. Você pode usar esses metadados para

verificar se uma regra relata sobre um recurso excluído. Para obter mais informações sobre itens de configuração, consulte Conceitos | Itens de configuração.

Inclua os seguintes trechos de código para verificar se há recursos excluídos e definir o resultado da avaliação de uma regra lambda AWS Config personalizada como `NOT_APPLICABLE` se ela reportasse sobre um recurso excluído:

Custom Lambda Rules (Node.js)

```
// Check whether the resource has been deleted. If the resource was deleted, then
 the evaluation returns not applicable.
function isApplicable(configurationItem, event) {
    checkDefined(configurationItem, 'configurationItem');
    checkDefined(event, 'event');
    const status = configurationItem.configurationItemStatus;
    const eventLeftScope = event.eventLeftScope;
    return (status === 'OK' || status === 'ResourceDiscovered') && eventLeftScope
 === false;
}
```

Custom Lambda Rules (Python)

```
# Check whether the resource has been deleted. If the resource was deleted, then the
 evaluation returns not applicable.
def is_applicable(configurationItem, event):
    try:
        check_defined(configurationItem, 'configurationItem')
        check_defined(event, 'event')
    except:
        return True
    status = configurationItem['configurationItemStatus']
    eventLeftScope = event['eventLeftScope']
    if status == 'ResourceDeleted':
        print("Resource Deleted, setting Compliance Status to NOT_APPLICABLE.")
    return (status == 'OK' or status == 'ResourceDiscovered') and not eventLeftScope
```

> **Note**
>
> AWS Config regras gerenciadas e regras de política AWS Config personalizadas lidam com esse comportamento por padrão.

Se você criar uma regra lambd AWS Config personalizada com Python usando AWS Config o Development Kit (RDK) AWS Config e a Development Kit Library RDKlib (), a classe Evaluator importada verificará esse comportamento. Para obter informações sobre como escrever regras com o RDK e RDKlib, consulte Como escrever regras com o RDK e. RDKlib

Regras do AWS Config vinculadas ao serviço

Uma regra do AWS Config vinculada ao serviço é um tipo exclusivo de regra de gerenciada pelo AWS Config que oferece suporte a outros serviços da AWS para criar regras de AWS Config em sua conta. As regras vinculadas ao serviço são predefinidas para incluir todas as permissões necessárias para chamar outros serviços da em seu nome. Essas regras são semelhantes a padrões que um serviço da AWS recomenda em sua conta da Conta da AWS para verificação de conformidade.

Essas regras do AWS Config vinculadas ao serviço pertencem às equipes de serviço da AWS. A equipe de serviço da AWS cria essas regras em sua conta da Conta da AWS. Você tem acesso somente leitura a essas regras. Você não poderá editar nem excluir essas regras se estiver inscrito no serviço da AWS ao qual elas estejam vinculadas.

Regras vinculadas ao serviço e o AWS Command Line Interface

Com a AWS CLI, as APIs PutConfigRule, DeleteConfigRule e DeleteEvaluationResults retornam acesso negado com a seguinte mensagem de erro:

```
INSUFFICIENT_SLCR_PERMISSIONS = "An AWS service owns
ServiceLinkedConfigRule. You do not have permissions to take action on this
rule."
```

Regras vinculadas ao serviço e ao console do AWS Config

No console do AWS Config, as regras do AWS Config vinculadas ao serviço ficam visíveis na página Rules (Regras). Os botões Editar e Excluir resultados estão acinzentados no console para impedir que você edite a regra. Você pode visualizar os detalhes da regra selecionando-a.

Regras vinculadas ao serviço, ações de remediação e pacotes de conformidade

Para adicionar ações de remediação a regras vinculadas ao serviço em um pacote de conformidade, você precisa adicionar a ação de remediação ao próprio modelo do pacote de conformidade e, em seguida, atualizar o pacote de conformidade com seu modelo atualizado. Para obter

informações sobre a atualização de pacotes de conformidade, consulte Implantação de um pacote de conformidade (console), Implantação de um pacote de conformidade (AWS CLI) e Gerenciamento de pacotes de conformidade organizacional.

Edição e exclusão de uma função vinculada ao serviço

Para editar ou excluir a regra vinculada ao serviço, entre em contato com o serviço da AWS que criou a regra. Por exemplo, para regras vinculadas ao serviço criadas pelo AWS Security Hub CSPM, você pode remover uma regra vinculada a serviços seguindo estas etapas no Guia do usuário do AWS Security Hub CSPM: Como desabilitar um padrão de segurança.

Gerenciamento AWS Config Regras em todas as contas da sua organização

> **Important**
>
> As regras organizacionais podem ser criadas somente com o uso da API ou da CLI. Essa operação não é suportada no AWS Config console.

AWS Config permite que você gerencie AWS Config regras em tudo Contas da AWS dentro de uma organização. Você pode:

- Crie, atualize e exclua AWS Config regras centralmente em todas as contas da sua organização.
- Implante um conjunto comum de AWS Config regras em todas as contas e especifique contas nas quais AWS Config as regras não devem ser criadas.
- Use as APIs da conta de gerenciamento AWS Organizations para aplicar a governança, garantindo que as AWS Config regras subjacentes não sejam modificáveis pelas contas dos membros da sua organização.

Considerações

Para implantações em diferentes regiões

A chamada de API para implantar regras e pacotes de conformidade em todas as contas é específica AWS da região. No nível da organização, você precisa alterar o contexto da sua chamada de API para uma região diferente se quiser implantar regras em outras regiões. Por exemplo, para implantar

uma regra no Leste dos EUA (Norte da Virgínia), altere a região para Leste dos EUA (Norte da Virgínia) e depois chame `PutOrganizationConfigRule`.

Para contas dentro de uma organização

Se uma nova conta entrar em uma organização, o pacote de regras ou conformidade será implantado nessa conta. Quando uma conta sai de uma organização, o pacote de regras ou conformidade é removido.

Se você implantar uma regra organizacional ou pacote de conformidade em uma conta de administrador da organização e, em seguida, estabelecer um administrador delegado e implantar uma regra organizacional ou pacote de conformidade na conta do administrador delegado, você não poderá ver a regra organizacional ou o pacote de conformidade na conta do administrador da organização a partir da conta do administrador delegado ou ver a regra organizacional ou o pacote de conformidade na conta do administrador delegado da conta do administrador da organização. As DescribeOrganizationConformancePacks APIs DescribeOrganizationConfigRules e só podem ver e interagir com os recursos relacionados à organização que foram implantados de dentro da conta que chama essas APIs.

Mecanismo de repetição para novas contas adicionadas a uma organização

A implantação de regras organizacionais e pacotes de conformidade existentes só será repetida por sete horas após a adição de uma conta à sua organização se um gravador não estiver disponível. Espera-se que você crie um gravador, se não houver um dentro de sete horas após a adição de uma conta à sua organização.

Contas de gerenciamento, administradores delegados e funções vinculadas a serviços da organização

Se você estiver usando uma conta de gerenciamento da organização e pretende usar um administrador delegado para implantação organizacional, saiba que isso AWS Config não criará automaticamente a função vinculada ao serviço (SLR). Você deve criar a função vinculada ao serviço (SLR) separadamente usando o IAM.

Se você não tiver uma SLR para sua conta de gerenciamento, não será possível implantar recursos nessa conta de uma conta de administrador delegado. Você ainda poderá implantar AWS Config regras nas contas dos membros a partir das contas gerenciais e de administrador delegado. Para obter mais informações, consulte Usar perfis vinculados ao serviço no Guia do usuário do AWS Identity and Access Management (IAM).

Implantação

Para obter informações sobre como integrar AWS Config com AWS Organizations, consulte AWS Config e AWS Organizations no Guia do AWS Organizations usuário. Certifique-se AWS Config de que a gravação esteja ativada antes de usar as seguintes APIs para gerenciar AWS Config regras em tudo Contas da AWS dentro de uma organização:

- PutOrganizationConfigRule, adiciona ou atualiza a regra de configuração da organização para toda a organização, avaliando se seus AWS recursos estão em conformidade com as configurações desejadas.
- DescribeOrganizationConfigRules, retorna uma lista de regras de configuração da organização.
- GetOrganizationConfigRuleDetailedStatus, retorna o status detalhado de cada conta membro em uma organização para uma determinada regra de configuração da organização.
- GetOrganizationCustomRulePolicy, retorna a definição da política contendo a lógica da regra de política personalizada de configuração da sua organização.
- DescribeOrganizationConfigRuleStatuses, fornece o status de implantação da regra de configuração da organização para uma organização.
- DeleteOrganizationConfigRule, exclui a regra de configuração da organização especificada e todos os resultados da avaliação de todas as contas membros dessa organização.

Adicionando AWS Config regras

Você pode usar o AWS Config console ou o AWS SDKs para adicionar regras.

Tópicos

- Adição de regras (console)
- Adicionando regras (AWS SDKs)

Adição de regras (console)

A página Regras mostra as regras e os resultados atuais de conformidade na tabela. O resultado de cada regra é Avaliar... até AWS Config terminar de avaliar seus recursos de acordo com a regra. Você pode atualizar os resultados com o botão de atualizar. Ao AWS Config concluir as avaliações, você poderá ver as regras e os tipos de recursos que estão em conformidade ou não. Para obter mais informações, consulte Visualizando informações de conformidade e resultados de avaliação de seus AWS recursos com AWS Config.

> **Note**
>
> Quando você adiciona uma nova regra, AWS Config avalia os recursos aplicáveis em seu inventário de recursos, incluindo os recursos registrados anteriormente. Por exemplo, se você registrou `AWS::IoT::Policy` recursos, mas depois os excluiu do registro, AWS Config retém os itens de configuração inicial (CIs) em seu inventário. Embora AWS Config não os atualize mais CIs quando os tipos de recursos associados são excluídos do registro, ele retém o último estado registrado e os avalia quando você adiciona regras aplicáveis. AWS Config não avalia recursos que não estão no inventário de recursos. Por exemplo, se você adicionar a amplify-branch-tagged regra, mas não registrar e nunca tiver registrado

`AWS::Amplify::Branch` recursos, não AWS Config poderá avaliar se as AWS Amplify filiais da sua conta estão em conformidade ou não.
Para obter mais informações, consulte AWS Recursos de gravação com AWS Config.

Adicionar regras

Para adicionar uma regra

1. Faça login no Console de gerenciamento da AWS e abra o AWS Config console em https://console.aws.amazon.com/config/casa.
2. No Console de gerenciamento da AWS menu, verifique se o seletor de região está definido como uma região que suporte AWS Config regras. Para obter a lista das regiões compatíveis, consulte Regiões e endpoints do AWS Config no Referência geral da Amazon Web Services.
3. Na barra de navegação à esquerda, selecione Rules (Regras).
4. Na página Rules (Regras), selecione Add rule (Adicionar regra).
5. Na página Especificar tipo de regra, especifique o tipo de regra concluindo as seguintes etapas:
   a. Digitar no campo de pesquisa para filtrar a lista de regras gerenciadas por nome, descrição e rótulo da regra. Por exemplo, digite EC2 para retornar regras que avaliam tipos de recursos do EC2, ou digite periodic (periódico) para retornar regras que possuam gatilho periódico.
   b. Você também pode criar sua própria regra. Escolha Criar regra personalizada usando Lambda ou Criar regra personalizada usando o Guard e siga o procedimento em Criação de regras personalizadas do AWS Config Lambda ou AWS Config Criação de regras de política personalizadas.
6. Na página Configurar regra, configure a regra através das seguintes etapas:
   a. Para Name (Nome), digite um nome exclusivo para a regra.
   b. Em Descrição, digite uma descrição para a regra.
   c. No Modo de avaliação, escolha quando, no processo de criação e gerenciamento de recursos, você AWS Config deseja avaliar seus recursos. Dependendo da regra, AWS Config você pode avaliar suas configurações de recursos antes de um recurso ser implantado, após a implantação de um recurso ou ambos.
      i. Escolha Ativar a avaliação proativa para permitir que você execute avaliações nas configurações de seus recursos antes de serem implantados.

Depois de ativar a avaliação proativa, você pode usar a StartResourceEvaluationAPI e a GetResourceEvaluationSummaryAPI para verificar se os recursos especificados nesses comandos seriam sinalizados como NÃO COMPATÍVEIS pelas regras proativas da sua conta na sua região.

Para obter mais informações sobre como usar esses comandos, consulte Avaliando seus recursos com AWS Config regras. Para obter uma lista de regras gerenciadas que oferecem suporte à avaliação proativa, consulte Lista de regras AWS Config gerenciadas por modo de avaliação.

ii. Escolha Ativar a avaliação de detecção para avaliar as definições de configuração de seus recursos existentes.

Para avaliação de detecção, existem dois tipos de gatilhos: Quando a configuração muda e Periódico.

A. Se os tipos de gatilho da sua regra incluírem alterações de configuração, especifique uma das seguintes opções para Escopo de alterações com o qual AWS Config invoca sua função Lambda:

- Recursos: quando um recurso que corresponde ao tipo de recurso especificado, ou ao tipo mais identificador, é criado, alterado ou excluído.
- Tags: quando um recurso com a tag especificada é criado, alterado ou excluído.
- Todas as alterações — Quando um recurso registrado por AWS Config é criado, alterado ou excluído.

AWS Config executa a avaliação quando detecta uma alteração em um recurso que corresponde ao escopo da regra. Você pode usar o escopo para restringir quais recursos iniciam as avaliações.

B. Se os tipos de gatilho da sua regra incluírem Periódico, especifique a frequência com a qual AWS Config invoca sua função Lambda.

d. Para Parâmetros, você poderá personalizar os valores das chaves fornecidas, se sua regra incluir parâmetros. Um parâmetro é um atributo que seus recursos devem ter antes de serem considerados compatíveis com a regra.

7. Na página Revisar e criar, revise todas as suas seleções antes de adicionar a regra à sua Conta da AWS. Se a regra ou a função não funcionar como esperado, você pode consultar uma das opções abaixo para Compatibilidade:

- Nenhum resultado relatado - AWS Config avaliou seus recursos de acordo com a regra. A regra não se aplicava aos AWS recursos em seu escopo, os recursos especificados foram excluídos ou os resultados da avaliação foram excluídos. Para obter resultados de avaliação, atualize a regra, mude seu escopo ou selecione Re-evaluate (Reavaliar).

  Essa mensagem também podem aparecer se a regra não relatar resultados de avaliação.
- Sem recursos no escopo - AWS Config não é possível avaliar seus AWS recursos registrados em relação a essa regra porque nenhum de seus recursos está dentro do escopo da regra. Para obter os resultados da avaliação, edite a regra e altere seu escopo ou adicione recursos AWS Config para registrar usando a página Configurações.
- Evaluations failed (Falha nas avaliações) – para obter informações que possam ajudar a determinar o problema, selecione o nome da regra para abrir sua página de detalhes e ver a mensagem de erro.

Adicionando regras (AWS SDKs)

Adicionar regras

Os exemplos de código a seguir mostram como usar o `PutConfigRule`.

CLI

AWS CLI

Para adicionar uma regra de Config AWS gerenciada

O comando a seguir fornece código JSON para adicionar uma regra Config AWS gerenciada:

```
aws configservice put-config-rule --config-rule file://
RequiredTagsForEC2Instances.json
```

`RequiredTagsForEC2Instances.json` é um arquivo JSON que contém a configuração da regra:

```
{
  "ConfigRuleName": "RequiredTagsForEC2Instances",
  "Description": "Checks whether the CostCenter and Owner tags are applied to EC2
 instances.",
  "Scope": {
```

```
    "ComplianceResourceTypes": [
      "AWS::EC2::Instance"
    ]
  },
  "Source": {
    "Owner": "AWS",
    "SourceIdentifier": "REQUIRED_TAGS"
  },
  "InputParameters": "{\"tag1Key\":\"CostCenter\",\"tag2Key\":\"Owner\"}"
}
```

Para o `ComplianceResourceTypes` atributo, esse código JSON limita o escopo a recursos do `AWS::EC2::Instance` tipo, então o AWS Config avaliará somente instâncias do EC2 em relação à regra. Como a regra é uma regra gerenciada, o atributo `Owner` é definido como `AWS` e o atributo `SourceIdentifier` é definido como o identificador da regra, `REQUIRED_TAGS`. Para o atributo `InputParameters`, as chaves de tag exigidas pela regra, `CostCenter` e `Owner` são especificados.

Se o comando for bem-sucedido, o AWS Config não retornará nenhuma saída. Para verificar a configuração da regra, execute o describe-config-rules comando e especifique o nome da regra.

Como adicionar uma regra do Config gerenciada pelo cliente

O seguinte comando fornece o código JSON para adicionar uma regra do Config gerenciada pelo cliente:

```
aws configservice put-config-rule --config-rule file://
InstanceTypesAreT2micro.json
```

`InstanceTypesAreT2micro.json` é um arquivo JSON que contém a configuração da regra:

```
{
  "ConfigRuleName": "InstanceTypesAreT2micro",
  "Description": "Evaluates whether EC2 instances are the t2.micro type.",
  "Scope": {
    "ComplianceResourceTypes": [
      "AWS::EC2::Instance"
    ]
  },
  "Source": {
```

```
    "Owner": "CUSTOM_LAMBDA",
    "SourceIdentifier": "arn:aws:lambda:us-
east-1:123456789012:function:InstanceTypeCheck",
    "SourceDetails": [
      {
        "EventSource": "aws.config",
        "MessageType": "ConfigurationItemChangeNotification"
      }
    ]
  },
  "InputParameters": "{\"desiredInstanceType\":\"t2.micro\"}"
}
```

Para o `ComplianceResourceTypes` atributo, esse código JSON limita o escopo a recursos do `AWS::EC2::Instance` tipo, então o AWS Config avaliará somente instâncias do EC2 em relação à regra. Como essa regra é uma regra gerenciada pelo cliente, o `Owner` atributo é definido como`CUSTOM_LAMBDA`, e o `SourceIdentifier` atributo é definido como o ARN da função Lambda AWS . O `SourceDetails` objeto é obrigatório. Os parâmetros especificados para o `InputParameters` atributo são passados para a função AWS Lambda quando o AWS Config a invoca para avaliar os recursos em relação à regra.

Se o comando for bem-sucedido, o AWS Config não retornará nenhuma saída. Para verificar a configuração da regra, execute o describe-config-rules comando e especifique o nome da regra.

Atualizando AWS Config regras

Você pode usar o AWS Config console ou o AWS SDKs para atualizar suas regras.

Tópicos

- Atualizar regras (console)
- Regras de atualização (AWS SDKs)

Atualizar regras (console)

A página Regras mostra as regras e os resultados atuais de conformidade na tabela. O resultado de cada regra é Avaliar... até AWS Config terminar de avaliar seus recursos de acordo com a regra. Você pode atualizar os resultados com o botão de atualizar. Ao AWS Config concluir as avaliações, você poderá ver as regras e os tipos de recursos que estão em conformidade ou não. Para obter mais informações, consulte Visualizando informações de conformidade e resultados de avaliação de seus AWS recursos com AWS Config.

Atualizar regras

Para atualizar uma regra

1. Faça login no Console de gerenciamento da AWS e abra o AWS Config console em https://console.aws.amazon.com/config/casa.
2. No Console de gerenciamento da AWS menu, verifique se o seletor de região está definido como uma região que suporte AWS Config regras. Para obter a lista das regiões compatíveis, consulte Regiões e endpoints do AWS Config no Referência geral da Amazon Web Services.
3. Na barra de navegação à esquerda, selecione Rules (Regras).
4. Escolha o ícone Editar regra para a regra que você deseja atualizar.
5. Modifique as configurações na página Editar regra para alterar a regra, conforme necessário.
6. Escolha Salvar.

Regras de atualização (AWS SDKs)

Atualizar regras

Se estiver atualizando uma regra que você adicionou anteriormente, não será possível especificar a regra pelo `ConfigRuleName`, `ConfigRuleId` ou pelo `ConfigRuleArn` no tipo de dados `ConfigRule` que você usa nessa solicitação. Use o mesmo comando `PutConfigRule` utilizado ao adicionar uma regra.

Os exemplos de código a seguir mostram como usar o `PutConfigRule`.

CLI

AWS CLI

Para adicionar uma regra de Config AWS gerenciada

O comando a seguir fornece código JSON para adicionar uma regra Config AWS gerenciada:

```
aws configservice put-config-rule --config-rule file://
RequiredTagsForEC2Instances.json
```

`RequiredTagsForEC2Instances.json` é um arquivo JSON que contém a configuração da regra:

```
{
  "ConfigRuleName": "RequiredTagsForEC2Instances",
  "Description": "Checks whether the CostCenter and Owner tags are applied to EC2
 instances.",
  "Scope": {
    "ComplianceResourceTypes": [
      "AWS::EC2::Instance"
    ]
  },
  "Source": {
    "Owner": "AWS",
    "SourceIdentifier": "REQUIRED_TAGS"
  },
  "InputParameters": "{\"tag1Key\":\"CostCenter\",\"tag2Key\":\"Owner\"}"
}
```

Para o `ComplianceResourceTypes` atributo, esse código JSON limita o escopo a recursos do `AWS::EC2::Instance` tipo, então o AWS Config avaliará somente instâncias do EC2 em relação à regra. Como a regra é uma regra gerenciada, o atributo `Owner` é definido como `AWS` e o atributo `SourceIdentifier` é definido como o identificador da regra, `REQUIRED_TAGS`. Para o atributo `InputParameters`, as chaves de tag exigidas pela regra, `CostCenter` e `Owner` são especificados.

Se o comando for bem-sucedido, o AWS Config não retornará nenhuma saída. Para verificar a configuração da regra, execute o describe-config-rules comando e especifique o nome da regra.

`InstanceTypesAreT2micro.json` é um arquivo JSON que contém a configuração da regra:

```
{
  "ConfigRuleName": "InstanceTypesAreT2micro",
  "Description": "Evaluates whether EC2 instances are the t2.micro type.",
  "Scope": {
    "ComplianceResourceTypes": [
      "AWS::EC2::Instance"
    ]
  },
  "Source": {
    "Owner": "CUSTOM_LAMBDA",
    "SourceIdentifier": "arn:aws:lambda:us-
east-1:123456789012:function:InstanceTypeCheck",
    "SourceDetails": [
      {
        "EventSource": "aws.config",
        "MessageType": "ConfigurationItemChangeNotification"
      }
    ]
  },
  "InputParameters": "{\"desiredInstanceType\":\"t2.micro\"}"
}
```

Para o `ComplianceResourceTypes` atributo, esse código JSON limita o escopo a recursos do `AWS::EC2::Instance` tipo, então o AWS Config avaliará somente instâncias do EC2 em relação à regra. Como essa regra é uma regra gerenciada pelo cliente, o `Owner` atributo é definido como`CUSTOM_LAMBDA`, e o `SourceIdentifier` atributo é definido como o ARN da função Lambda AWS . O `SourceDetails` objeto é obrigatório. Os parâmetros especificados para o `InputParameters` atributo são passados para a função AWS Lambda quando o AWS Config a invoca para avaliar os recursos em relação à regra.

Excluindo regras AWS Config

Você pode usar o AWS Config console ou o AWS SDKs para excluir suas regras.

Tópicos

- Considerações
- Como excluir regras (console)
- Excluindo regras ()AWS SDKs

Considerações

Recomendação: considere excluir o tipo de recurso **`AWS::Config::ResourceCompliance`** da gravação antes de excluir regras.

A exclusão de regras cria itens de configuração (CIs) `AWS::Config::ResourceCompliance` que podem afetar seus custos com o gravador de configuração. Se você estiver excluindo regras que avaliam um grande número de tipos de recursos, isso pode levar a um aumento no número de CIs registros.

Para evitar os custos associados, você pode optar por desabilitar a gravação do tipo de recurso `AWS::Config::ResourceCompliance` antes de excluir regras e reabilitar a gravação após a exclusão das regras.

No entanto, como a exclusão de regras é um processo assíncrono, esse processo pode levar uma hora ou mais para ser concluído. Durante o período em que a gravação estiver desabilitada para `AWS::Config::ResourceCompliance`, as avaliações de regras não serão registradas no histórico do recurso correspondente.

Como excluir regras (console)

A página Regras mostra as regras e os resultados atuais de conformidade na tabela. O resultado de cada regra é Avaliar... até AWS Config terminar de avaliar seus recursos de acordo com a regra. Você pode atualizar os resultados com o botão de atualizar. Ao AWS Config concluir as avaliações, você poderá ver as regras e os tipos de recursos que estão em conformidade ou não. Para obter mais informações, consulte Visualizando informações de conformidade e resultados de avaliação de seus AWS recursos com AWS Config.

> **Note**
>
> AWS Config avalia somente os tipos de recursos que está gravando. Por exemplo, se você adicionar a regra habilitada para o cloudtrail, mas não registrar o tipo de recurso de CloudTrail trilha, não AWS Config poderá avaliar se as trilhas em sua conta estão em conformidade ou não. Para obter mais informações, consulte AWS Recursos de gravação com AWS Config.

Como excluir regras

Visualizar informações de conformidade para suas regras

Os exemplos de código a seguir mostram como usar o `DescribeComplianceByConfigRule`.

CLI

AWS CLI

Para obter informações de conformidade para suas regras de AWS Config

O comando a seguir retorna informações de conformidade para cada regra AWS do Config violada por um ou mais recursos: AWS

```
aws configservice describe-compliance-by-config-rule --compliance-
types NON_COMPLIANT
```

Na saída, o valor de cada atributo `CappedCount` indica quantos recursos não estão em conformidade com a regra relacionada. Por exemplo, a saída a seguir indica que três recursos não estão em conformidade com a regra chamada `InstanceTypesAreT2micro`.

Saída:

```
{
    "ComplianceByConfigRules": [

Ativando a avaliação proativa para AWS Config Regras

Você pode usar o AWS Config console ou os AWS SDKs para ativar as regras de avaliação proativa. Para ver uma lista de tipos de recurso e regras gerenciadas que permitem uma avaliação proativa, consulte Componentes de uma regra | Modos de avaliação.

Tópicos

- Como ativar a avaliação proativa (console)
- Ativando a avaliação proativa (AWS SDKs)

Como ativar a avaliação proativa (console)

A página Regras mostra as regras e os resultados atuais de conformidade na tabela. O resultado de cada regra é Avaliar... até AWS Config terminar de avaliar seus recursos de acordo com a regra. Você pode atualizar os resultados com o botão de atualizar.

Ao AWS Config concluir as avaliações, você poderá ver as regras e os tipos de recursos que estão em conformidade ou não. Para obter mais informações, consulte Visualizando informações de conformidade e resultados de avaliação de seus AWS recursos com AWS Config.

> **Note**
>
> AWS Config avalia somente os tipos de recursos que está gravando. Por exemplo, se você adicionar a regra habilitada para o cloudtrail, mas não registrar o tipo de recurso de CloudTrail trilha, não AWS Config poderá avaliar se as trilhas em sua conta estão em conformidade ou não. Para obter mais informações, consulte AWS Recursos de gravação com AWS Config.

Como ativar a avaliação proativa

Você pode usar a avaliação proativa para avaliar os recursos antes que eles sejam implantados. Isso permite avaliar se um conjunto de propriedades de recursos, se usado para definir um AWS recurso, seria COMPATÍVEL ou NÃO COMPATÍVEL, considerando o conjunto de regras proativas que você tem em sua conta na sua região.

O Esquema do tipo de recurso indica as propriedades de um recurso. Você pode encontrar o esquema do tipo de recurso em "extensões AWS públicas" no AWS CloudFormation registro ou com o seguinte comando da CLI:

```
aws cloudformation describe-type --type-name "AWS::S3::Bucket" --type RESOURCE
```

Para obter mais informações, consulte Gerenciamento de extensões por meio do CloudFormation registro e da referência de tipos de AWS recursos e propriedades no Guia AWS CloudFormation do usuário.

> **Note**
>
> As regras proativas não corrigem os recursos marcados como NON_COMPLIANT nem impedem que eles sejam implantados.

Para ativar a avaliação proativa

1. Faça login no Console de gerenciamento da AWS e abra o AWS Config console em https://console.aws.amazon.com/config/home.
2. No Console de gerenciamento da AWS menu, verifique se o seletor de região está definido como uma região que ofereça suporte a AWS Config regras. Para obter a lista das regiões da AWS compatíveis, consulte Regiões e endpoints do AWS Config no Referência geral da Amazon Web Services.
3. Na barra de navegação à esquerda, selecione Rules (Regras). Para obter uma lista de regras gerenciadas que oferecem suporte à avaliação proativa, consulte Lista de regras AWS Config gerenciadas por modo de avaliação.
4. Escolha uma regra e, em seguida, escolha Editar regra para a regra que você deseja atualizar.
5. Para o Modo de avaliação, escolha Ativar a avaliação proativa para permitir que você execute avaliações nas definições de configuração de seus recursos antes de serem implantados.
6. Escolha Salvar.

Depois de ativar a avaliação proativa, você pode usar a StartResourceEvaluationAPI e a GetResourceEvaluationSummaryAPI para verificar se os recursos especificados nesses comandos seriam sinalizados como NÃO COMPATÍVEIS pelas regras proativas da sua conta na sua região.

Por exemplo, comece com a StartResourceEvaluation API:

```
aws configservice start-resource-evaluation --evaluation-mode PROACTIVE
                --resource-details '{"ResourceId":"MY_RESOURCE_ID",
                                     "ResourceType":"AWS::RESOURCE::TYPE",

 "ResourceConfiguration":"RESOURCE_DEFINITION_AS_PER_THE_RESOURCE_CONFIGURATION_SCHEMA",
```

```
 "ResourceConfigurationSchemaType":"CFN_RESOURCE_SCHEMA"}'
```

Você deve receber o `ResourceEvaluationId` na saída:

```
{
    "ResourceEvaluationId": "MY_RESOURCE_EVALUATION_ID"
}
```

Em seguida, use o `ResourceEvaluationId` com a GetResourceEvaluationSummary API para verificar o resultado da avaliação:

```
aws configservice get-resource-evaluation-summary
    --resource-evaluation-id MY_RESOURCE_EVALUATION_ID
```

Você deve receber uma saída semelhante à seguinte:

```
{
    "ResourceEvaluationId": "MY_RESOURCE_EVALUATION_ID",
    "EvaluationMode": "PROACTIVE",
    "EvaluationStatus": {
        "Status": "SUCCEEDED"
    },
    "EvaluationStartTimestamp": "2022-11-15T19:13:46.029000+00:00",
    "Compliance": "COMPLIANT",
    "ResourceDetails": {
        "ResourceId": "MY_RESOURCE_ID",
        "ResourceType": "AWS::RESOURCE::TYPE",
        "ResourceConfiguration":
 "RESOURCE_DEFINITION_AS_PER_THE_RESOURCE_CONFIGURATION_SCHEMA"
    }
}
```

Para ver informações adicionais sobre o resultado da avaliação, como qual regra sinalizou um recurso como NON_COMPLIANT, use a API. GetComplianceDetailsByResource

Ativando a avaliação proativa (AWS SDKs)

Ativando a avaliação proativa (AWS CLI)

Você pode usar a avaliação proativa para avaliar os recursos antes que eles sejam implantados. Isso permite avaliar se um conjunto de propriedades de recursos, se usado para definir um AWS recurso, seria COMPATÍVEL ou NÃO COMPATÍVEL, considerando o conjunto de regras proativas que você tem em sua conta na sua região.

O Esquema do tipo de recurso indica as propriedades de um recurso. Você pode encontrar o esquema do tipo de recurso em "extensões AWS públicas" no AWS CloudFormation registro ou com o seguinte comando da CLI:

```
aws cloudformation describe-type --type-name "AWS::S3::Bucket" --type RESOURCE
```

Para obter mais informações, consulte Gerenciamento de extensões por meio do CloudFormation registro e da referência de tipos de AWS recursos e propriedades no Guia AWS CloudFormation do usuário.

> **Note**
>
> As regras proativas não corrigem os recursos marcados como NON_COMPLIANT nem impedem que eles sejam implantados.

Para ativar a avaliação proativa

Use o comando `put-config-rule` e habilite `PROACTIVE` para`EvaluationModes`.

Depois de ativar a avaliação proativa, você pode usar o comando da CLI start-resource-evaluation e o comando da CLI get-resource-evaluation-summary para verificar se os recursos especificados nesses comandos seriam sinalizados como NON_COMPLIANT pelas regras proativas da sua conta na sua região.

Por exemplo, comece com o comando start-resource-evaluation:

```
aws configservice start-resource-evaluation --evaluation-mode PROACTIVE
                --resource-details '{"ResourceId":"MY_RESOURCE_ID",
```

```
                                        "ResourceType":"AWS::RESOURCE::TYPE",

 "ResourceConfiguration":"RESOURCE_DEFINITION_AS_PER_THE_RESOURCE_CONFIGURATION_SCHEMA",

 "ResourceConfigurationSchemaType":"CFN_RESOURCE_SCHEMA"}'
```

Você deve receber o `ResourceEvaluationId` na saída:

```
{
    "ResourceEvaluationId": "MY_RESOURCE_EVALUATION_ID"
}
```

Em seguida, use `ResourceEvaluationId` com o get-resource-evaluation-summary para verificar o resultado da avaliação:

```
aws configservice get-resource-evaluation-summary
    --resource-evaluation-id MY_RESOURCE_EVALUATION_ID
```

Você deve receber uma saída semelhante à seguinte:

```
{
    "ResourceEvaluationId": "MY_RESOURCE_EVALUATION_ID",
    "EvaluationMode": "PROACTIVE",
    "EvaluationStatus": {
        "Status": "SUCCEEDED"
    },
    "EvaluationStartTimestamp": "2022-11-15T19:13:46.029000+00:00",
    "Compliance": "COMPLIANT",
    "ResourceDetails": {
        "ResourceId": "MY_RESOURCE_ID",
        "ResourceType": "AWS::RESOURCE::TYPE",
        "ResourceConfiguration":
 "RESOURCE_DEFINITION_AS_PER_THE_RESOURCE_CONFIGURATION_SCHEMA"
    }
}
```

Para ver informações adicionais sobre o resultado da avaliação, como qual regra sinalizou um recurso como NON_COMPLIANT, use o comando da CLI get-compliance-details-by-resource.

O Esquema do tipo de recurso indica as propriedades de um recurso. Você pode encontrar o esquema do tipo de recurso em "extensões AWS públicas" no AWS CloudFormation registro ou com o seguinte comando da CLI:

```
aws cloudformation describe-type --type-name "AWS::S3::Bucket" --type RESOURCE
```

Para obter mais informações, consulte Gerenciamento de extensões por meio do CloudFormation registro e da referência de tipos de AWS recursos e propriedades no Guia AWS CloudFormation do usuário.

> **Note**
>
> As regras proativas não corrigem os recursos marcados como NON_COMPLIANT nem impedem que eles sejam implantados.

Para ativar a avaliação proativa de uma regra

Use a PutConfigRuleação e habilite `PROACTIVE` para`EvaluationModes`.

Depois de ativar a avaliação proativa, você pode usar a StartResourceEvaluationAPI e a GetResourceEvaluationSummaryAPI para verificar se os recursos especificados nesses comandos seriam sinalizados como NÃO COMPATÍVEIS pelas regras proativas da sua conta na sua região. Por exemplo, comece com a StartResourceEvaluation API:

```
aws configservice start-resource-evaluation --evaluation-mode PROACTIVE
```

```
                --resource-details '{"ResourceId":"MY_RESOURCE_ID",
                                     "ResourceType":"AWS::RESOURCE::TYPE",

 "ResourceConfiguration":"RESOURCE_DEFINITION_AS_PER_THE_RESOURCE_CONFIGURATION_SCHEMA",

 "ResourceConfigurationSchemaType":"CFN_RESOURCE_SCHEMA"}'
```

Você deve receber o `ResourceEvaluationId` na saída:

```
{
    "ResourceEvaluationId": "MY_RESOURCE_EVALUATION_ID"
}
```

Em seguida, use o `ResourceEvaluationId` com a GetResourceEvaluationSummary API para verificar o resultado da avaliação:

```
aws configservice get-resource-evaluation-summary
    --resource-evaluation-id MY_RESOURCE_EVALUATION_ID
```

Você deve receber uma saída semelhante à seguinte:

```
{
    "ResourceEvaluationId": "MY_RESOURCE_EVALUATION_ID",
    "EvaluationMode": "PROACTIVE",
    "EvaluationStatus": {
        "Status": "SUCCEEDED"
    },
    "EvaluationStartTimestamp": "2022-11-15T19:13:46.029000+00:00",
    "Compliance": "COMPLIANT",
    "ResourceDetails": {
        "ResourceId": "MY_RESOURCE_ID",
        "ResourceType": "AWS::RESOURCE::TYPE",
        "ResourceConfiguration":
 "RESOURCE_DEFINITION_AS_PER_THE_RESOURCE_CONFIGURATION_SCHEMA"
    }
}
```

Para ver informações adicionais sobre o resultado da avaliação, como qual regra sinalizou um recurso como NON_COMPLIANT, use a API. GetComplianceDetailsByResource

> **Note**
>
> Para obter uma lista de regras gerenciadas que oferecem suporte à avaliação proativa, consulte Lista de regras AWS Config gerenciadas por modo de avaliação.

Enviando avaliações de regras para o Security Hub CSPM

Depois de adicionar uma AWS Config regra, você também pode enviar avaliações de regras para o. AWS Security Hub CSPM A integração entre AWS Config o Security Hub CSPM permite que você faça a triagem e corrija as avaliações de regras junto com outras configurações incorretas e problemas de segurança.

Enviar avaliações de regras para o Security Hub CSPM

Para enviar avaliações de regras para o Security Hub CSPM, você deve primeiro configurar AWS Security Hub CSPM e AWS Config, em seguida, adicionar pelo menos uma regra AWS Config gerenciada ou personalizada. Depois disso, começa AWS Config imediatamente a enviar avaliações de regras para o Security Hub CSPM. O Security Hub CSPM enriquece as avaliações de regras e as transforma em descobertas do Security Hub CSPM.

Para obter mais informações sobre essa integração, consulte Integrações AWS de serviços disponíveis no Guia do AWS Security Hub CSPM usuário.

Avaliando seus recursos com AWS Config Regras

Quando você cria regras personalizadas ou usa regras gerenciadas, AWS Config avalia seus recursos em relação a essas regras. Você pode executar avaliações sob demanda para recursos em relação às suas regras. Por exemplo, isso é útil quando você cria uma regra personalizada e deseja verificar se AWS Config está avaliando corretamente seus recursos ou identificar se há algum problema com a lógica de avaliação da sua AWS Lambda função.

Exemplo

1. Você cria uma regra personalizada que avalia se os usuários do IAM; têm chaves de acesso ativas.
2. AWS Config avalia seus recursos em relação à sua regra personalizada.

3. Existe na sua conta um usuário do IAM; que não tem uma chave de acesso ativa. Sua regra não sinaliza corretamente esse recurso como NON_COMPLIANT.
4. Você corrige a regra e inicia a avaliação novamente.
5. Como você corrigiu a regra, ela avalia corretamente seus recursos e sinaliza o recurso de usuário do IAM; como NON_COMPLIANT.

Ao adicionar uma regra à sua conta, você pode especificar quando, no processo de criação e gerenciamento de recursos, você AWS Config deseja avaliar seus recursos. O processo de criação e gerenciamento de recursos é conhecido como provisionamento de recursos. Você escolhe o modo de avaliação para especificar quando, nesse processo, AWS Config deseja avaliar seus recursos.

Dependendo da regra, AWS Config pode avaliar suas configurações de recursos antes de um recurso ser implantado, depois de um recurso ter sido implantado ou ambos. Avaliar um recurso antes que ele seja implantado é uma avaliação proativa. Avaliar um recurso após sua implantação é uma avaliação de detecção.

Modo proativo

Use a avaliação proativa para avaliar os recursos antes de serem implantados. Isso permite avaliar se um conjunto de propriedades de recursos, se usado para definir um AWS recurso, seria COMPATÍVEL ou NÃO COMPATÍVEL, considerando o conjunto de regras proativas que você tem em sua conta na sua região.

O Esquema do tipo de recurso indica as propriedades de um recurso. Você pode encontrar o esquema do tipo de recurso em "extensões AWS públicas" no AWS CloudFormation registro ou com o seguinte comando da CLI:

```
aws cloudformation describe-type --type-name "AWS::S3::Bucket" --type RESOURCE
```

Para obter mais informações, consulte Gerenciamento de extensões por meio do CloudFormation registro e da referência de tipos de AWS recursos e propriedades no Guia AWS CloudFormation do usuário.

> **Note**
>
> As regras proativas não corrigem os recursos marcados como NON_COMPLIANT nem impedem que eles sejam implantados.

Avaliar seus recursos

Para ativar a avaliação proativa

1. Faça login no Console de gerenciamento da AWS e abra o AWS Config console em https://console.aws.amazon.com/config/home.
2. No Console de gerenciamento da AWS menu, verifique se o seletor de região está definido como uma região que ofereça suporte a AWS Config regras. Para obter a lista das regiões da AWS compatíveis, consulte Regiões e endpoints do AWS Config no Referência geral da Amazon Web Services.
3. Na barra de navegação à esquerda, selecione Rules (Regras). Para obter uma lista de regras gerenciadas que oferecem suporte à avaliação proativa, consulte Lista de regras AWS Config gerenciadas por modo de avaliação.
4. Escolha uma regra e, em seguida, escolha Editar regra para a regra que você deseja atualizar.
5. Para o Modo de avaliação, escolha Ativar a avaliação proativa para permitir que você execute avaliações nas definições de configuração de seus recursos antes de serem implantados.
6. Escolha Salvar.

> **Note**
>
> Você também pode ativar a avaliação proativa usando o `put-config-rule`comando e habilitando `PROACTIVE` para `EvaluationModes` ou usando a PutConfigRuleação e habilitando `PROACTIVE` para`EvaluationModes`.

Depois de ativar a avaliação proativa, você pode usar a StartResourceEvaluationAPI e a GetResourceEvaluationSummaryAPI para verificar se os recursos especificados nesses comandos seriam sinalizados como NÃO COMPATÍVEIS pelas regras proativas da sua conta na sua região.

Por exemplo, comece com a StartResourceEvaluation API:

```
aws configservice start-resource-evaluation --evaluation-mode PROACTIVE
                --resource-details '{"ResourceId":"MY_RESOURCE_ID",
                                     "ResourceType":"AWS::RESOURCE::TYPE",

 "ResourceConfiguration":"RESOURCE_DEFINITION_AS_PER_THE_RESOURCE_CONFIGURATION_SCHEMA",

 "ResourceConfigurationSchemaType":"CFN_RESOURCE_SCHEMA"}'
```

Você deve receber o `ResourceEvaluationId` na saída:

```
{
    "ResourceEvaluationId": "MY_RESOURCE_EVALUATION_ID"
}
```

Em seguida, use o `ResourceEvaluationId` com a GetResourceEvaluationSummary API para verificar o resultado da avaliação:

```
aws configservice get-resource-evaluation-summary
    --resource-evaluation-id MY_RESOURCE_EVALUATION_ID
```

Você deve receber uma saída semelhante à seguinte:

```
{
    "ResourceEvaluationId": "MY_RESOURCE_EVALUATION_ID",
    "EvaluationMode": "PROACTIVE",
    "EvaluationStatus": {
        "Status": "SUCCEEDED"
    },
    "EvaluationStartTimestamp": "2022-11-15T19:13:46.029000+00:00",
    "Compliance": "COMPLIANT",
    "ResourceDetails": {
        "ResourceId": "MY_RESOURCE_ID",
        "ResourceType": "AWS::RESOURCE::TYPE",
        "ResourceConfiguration":
 "RESOURCE_DEFINITION_AS_PER_THE_RESOURCE_CONFIGURATION_SCHEMA"
    }
}
```

Para ver informações adicionais sobre o resultado da avaliação, como qual regra sinalizou um recurso como NON_COMPLIANT, use a API. GetComplianceDetailsByResource

Modo de detecção

Use a avaliação de detecção para avaliar os recursos que já foram implantados. Isso permite avaliar as definições de configuração de seus recursos existentes.

Avaliar seus recursos (console)

1. Faça login no Console de gerenciamento da AWS e abra o AWS Config console em https://console.aws.amazon.com/config/home.
2. No Console de gerenciamento da AWS menu, verifique se o seletor de região está definido como uma região que ofereça suporte a AWS Config regras. Para obter a lista das regiões compatíveis, consulte Regiões e endpoints do AWS Config no Referência geral da Amazon Web Services.
3. No painel de navegação, escolha Regras. A página Regras mostra o nome, a ação de correção associada e o status de conformidade de cada regra.
4. Escolha uma regra na tabela.
5. Na lista suspensa Ações, escolha. Re-evaluate
6. AWS Config começa a avaliar os recursos de acordo com sua regra.

> **Note**
>
> Você pode reavaliar uma regra uma vez a cada minuto. Você deve aguardar AWS Config a conclusão da avaliação de sua regra antes de iniciar outra avaliação. Você não pode executar uma avaliação se, ao mesmo tempo, a regra estiver sendo atualizada ou se a regra for excluída.

Avaliar seus recursos (CLI)

- Use o comando start-config-rules-evaluation:

```
$ aws configservice start-config-rules-evaluation --config-rule-
names ConfigRuleName
```

AWS Config começa a avaliar as configurações de recursos registradas em relação à sua regra. Você também pode especificar várias regras em sua solicitação:

```
$ aws configservice start-config-rules-evaluation --config-rule-
names ConfigRuleName1 ConfigRuleName2 ConfigRuleName3
```

Avaliar seus recursos (API)

Use a ação StartConfigRulesEvaluation.

Excluindo resultados de avaliação das regras AWS Config

Depois de AWS Config avaliar sua regra, você pode ver os resultados da avaliação na página Regras ou na página de detalhes das Regras da regra. Se os resultados da avaliação estiverem incorretos ou se você quiser avaliar novamente, você pode excluir os resultados da avaliação atual para a regra. Por exemplo, se a regra estava avaliando incorretamente os seus recursos, ou você excluiu recursos recentemente da sua conta, pode excluir os resultados da avaliação e, em seguida, executar nova avaliação.

Deleting Evaluation Results (Console)

1. Faça login no Console de gerenciamento da AWS e abra o AWS Config console em https://console.aws.amazon.com/config/casa.
2. No Console de gerenciamento da AWS menu, verifique se o seletor de região está definido como uma AWS região que ofereça suporte a AWS Config regras. Para obter a lista das regiões compatíveis, consulte Regiões e endpoints do AWS Config no Referência geral da Amazon Web Services.
3. No painel de navegação, escolha Regras. A página Regras mostra o nome, a ação de correção associada e o status de conformidade de cada regra.
4. Escolha uma regra na tabela.
5. Na lista suspensa Ações, escolha Excluir resultados.
6. Quando solicitado, digite Excluir (essa entrada diferencia maiúsculas de minúsculas) e escolha Excluir. Depois de excluir uma avaliação, você não poderá recuperá-la.
7. Depois que os resultados de avaliação são excluídos, você pode iniciar manualmente uma nova avaliação.

Deleting Evaluation Results (CLI)

- Use o comando delete-evaluation-results.

```
$ aws configservice delete-evaluation-results --config-rule-name ConfigRuleName
```

  AWS Config exclui os resultados da avaliação da regra.

Deleting Evaluation Results (API)

Use a ação DeleteEvaluationResults.

Solução de problemas para AWS Config regras

Verifique os seguintes problemas para solucionar problemas se você não conseguir excluir uma AWS Config regra ou receber um erro semelhante ao seguinte: “Ocorreu um erro com AWS Config”.

A entidade AWS Identity and Access Management (IAM) tem permissões para a DeleteConfigRule API

1. Abra o console do IAM em https://console.aws.amazon.com/iam/.
2. No painel de navegação, selecione Usuários ou Funções.
3. Escolha o usuário ou a função que você usou para excluir a AWS Config regra e expanda Políticas de permissões.
4. Na guia Permissões, escolha JSON.
5. No painel de visualização do JSON, confirme se a política do IAM permite permissões para a DeleteConfigRule API.

O limite de permissão da entidade IAM permite a API DeleteConfigRule

Se a entidade IAM tiver um limite de permissões, certifique-se de que ela permita permissões para a DeleteConfigRule API.

1. Abra o console do IAM em https://console.aws.amazon.com/iam/.
2. No painel de navegação, selecione Usuários ou Funções.
3. Escolha o usuário ou a função que você usou para excluir a AWS Config regra, expanda o limite de permissões e escolha JSON.
4. No painel de visualização do JSON, confirme se a política do IAM permite permissões para a DeleteConfigRule API.

> **Warning**
>
> Os usuários do IAM têm credenciais de longo prazo, o que representa um risco de segurança. Para ajudar a reduzir esse risco, recomendamos que você forneça a esses

usuários somente as permissões necessárias para realizar a tarefa e que você os remova quando não forem mais necessários.

A política de controle de serviços (SCP) permite a API DeleteConfigRule

1. Abra o AWS Organizations console em https://console.aws.amazon.com/organizations/ Usando a conta https://docs.aws.amazon.com/organizations/latest/userguide/orgs_getting-started_concepts.html de gerenciamento da organização.
2. Em Nome da conta, escolha a Conta da AWS.
3. Em Políticas, expanda Políticas de controle de serviços e observe as políticas de SCP anexadas.
4. Na parte superior da página, escolha Políticas.
5. Selecione a política e escolha Visualizar detalhes.
6. No painel de visualização do JSON, confirme se a política permite a DeleteConfigRule API.

A regra não é uma regra vinculada ao serviço

Quando você ativa um padrão de segurança, AWS Security Hub CSPM cria regras vinculadas ao serviço para você. Você não pode excluir essas regras vinculadas ao serviço usando AWS Config, e o botão de exclusão fica acinzentado. Para remover uma regra vinculada ao serviço, consulte Desabilitar um padrão de segurança no Guia do usuário do Security Hub CSPM.

Nenhuma ação de correção está em andamento

Você não pode excluir AWS Config regras que tenham ações de correção em andamento. Siga as etapas para excluir a ação de correção associada a essa regra. Em seguida, tente excluir a regra novamente.

> **Important**
>
> Exclua somente ações de correção que estejam nos estados de falha ou sucesso.

Pacotes de conformidade para AWS Config

Um pacote de conformidade é um conjunto de AWS Config regras e ações corretivas que podem ser facilmente implantadas como uma única entidade em uma conta e região ou em uma organização. AWS Organizations

Os pacotes de conformidade são criados usando um modelo YAML criado por você que contenha a lista de regras gerenciadas ou personalizadas do AWS Config e as ações de correção. Você também pode usar AWS Systems Manager documentos (documentos SSM) para armazenar seus modelos de pacotes de conformidade AWS e implantá-los diretamente usando nomes de documentos SSM. É possível implantar o modelo usando o console do AWS Config ou a AWS CLI.

Para começar rapidamente e avaliar seu AWS ambiente, use um dos exemplos de modelos de pacotes de conformidade. Você também pode criar um arquivo YAML do pacote de conformidade do zero com base no Pacote de conformidade personalizado.

Visualizar dados de conformidade no painel de pacotes de conformidade para o AWS Config

A página principal dos Pacotes de Conformidade exibe todos os pacotes de conformidade que você tem atualmente na sua Conta da AWS. A página também contém o nome, o status da implantação e a pontuação de conformidade de cada pacote de conformidade. A pontuação de conformidade é a porcentagem do número de combinações de recursos e regras compatíveis em um pacote de conformidade em comparação com o número total de combinações possíveis de regras e recursos.

Você pode usar esse painel para entender o nível de conformidade de seus pacotes de conformidade e usar a pontuação de conformidade para monitorar o progresso da correção, realizar comparações entre diferentes conjuntos de requisitos e ver o impacto que uma alteração ou implantação específica tem em um pacote de conformidade.

Navegar pela página principal dos pacotes de conformidade

1. Faça login no Console de gerenciamento da AWS e abra o console do AWS Config em https://console.aws.amazon.com/config/home.
2. Navegue até a página Pacotes de conformidade. Analise seus pacotes de conformidade e sua pontuação de conformidade. Você também pode fazer o seguinte:
   - Para adicionar e configurar um novo pacote de conformidade, escolha Implantar pacote de conformidade.
   - Para excluir um pacote de conformidade e seus dados, altere as configurações ou visualize detalhes adicionais, como o local de entrega ou os parâmetros, escolha um pacote de conformidade e escolha Ações.

     > **Note**
     >
     > Não é possível editar um pacote de conformidade implantado. Você pode modificar as outras seleções a qualquer momento escolhendo o nome do pacote de conformidade e Editar no menu suspenso Ações.

   - Para ver o histórico das alterações do estado de conformidade, escolha um pacote de conformidade e escolha o Cronograma do pacote de conformidade. Para obter mais informações, consulte Viewing the Compliance History Timeline for Conformance Packs.

- Para visualizar o status da implantação, a pontuação de conformidade, o cronograma da pontuação de conformidade e as regras de um pacote de conformidade em uma exibição detalhada, selecione um pacote de conformidade e escolha Exibir.

Pré-requisito para pacotes de conformidade para AWS Config

Antes de implantar seu pacote de conformidade, ative a gravação. AWS Config

Tópicos

- Etapa 1: iniciar a AWS Config gravação (obrigatório para todos os pacotes de conformidade)
- Etapa 2: pré-requisitos adicionais por tipo de pacote de conformidade

Etapa 1: iniciar a AWS Config gravação (obrigatório para todos os pacotes de conformidade)

1. Faça login no Console de gerenciamento da AWS e abra o AWS Config console em https://console.aws.amazon.com/config/casa.
2. Selecione Configurações no painel de navegação.
3. Para iniciar a gravação, em Recording is off (A gravação está desativada), selecione Turn on (Ativar). Quando solicitado, escolha Continuar.

Etapa 2: pré-requisitos adicionais por tipo de pacote de conformidade

A. Pré-requisitos para usar um pacote de conformidade com correção

Antes de implantar pacotes de conformidade usando modelos de amostra com remediação, você deve criar recursos apropriados, como automação, assumir funções e outros AWS recursos com base em sua meta de remediação.

Se tiver uma função de automação existente que está usando para correção usando documentos SSM, você poderá fornecer diretamente o ARN dessa função. Se tiver recursos, você poderá fornecê-los no modelo.

> **Note**
>
> Ao implantar um pacote de conformidade com correção em uma organização, o ID da conta de gerenciamento da organização precisa ser especificado. Caso contrário, durante a implantação do pacote de conformidade organizacional, o AWS Config substituirá automaticamente o ID da conta de gerenciamento pelo ID da conta de membro.

AWS Config não oferece suporte a funções CloudFormation intrínsecas para a função de execução de automação ou o. `ConfigRuleName` Você deve fornecer o ARN exato do perfil como uma string e usar o nome completo da regra sem funções intrínsecas.

Para obter mais informações sobre como passar o ARN exato, consulte Modelos de amostra de pacotes de conformidade para AWS Config. Ao usar modelos de exemplo, atualize o ID da sua conta e o ID da conta de gerenciamento da organização.

B. Pré-requisitos para usar um pacote de conformidade com uma ou mais regras personalizadas AWS Config

Antes de implantar um pacote de conformidade com uma ou mais AWS Config regras personalizadas, crie recursos apropriados, como a AWS Lambda função e a função de execução correspondente.

Se você tiver uma AWS Config regra personalizada existente, poderá fornecer diretamente a AWS Lambda função `ARN` of para criar outra instância dessa regra personalizada como parte do pacote.

Se você não tiver uma AWS Config regra personalizada existente, poderá criar uma AWS Lambda função e usar o ARN da função Lambda. Para obter mais informações, consulte AWS Config Regras personalizadas.

Se sua AWS Lambda função estiver presente em outra Conta da AWS, você poderá criar AWS Config regras com a autorização apropriada da AWS Lambda função entre contas. Para obter mais informações, consulte Como gerenciar AWS Config regras de forma centralizada em várias postagens Contas da AWS do blog.

> Ao implantar pacotes de conformidade entre contas, o nome do bucket Amazon S3 de entrega deve começar com `awsconfigconforms`.

C. Pré-requisitos para pacotes de conformidade da organização

Especifique um ARN de função de execução de automação para essa correção no modelo se o modelo de entrada tiver uma configuração de correção automática. Verifique se existe uma função com o nome especificado em todas as contas (gerenciamento e membro) de uma organização. Você deve criar essa função em todas as contas antes de chamar `PutOrganizationConformancePack`. Você pode criar essa função manualmente ou usando os AWS CloudFormation conjuntos de pilhas para criar essa função em todas as contas.

Se seu modelo usa uma função AWS CloudFormation intrínseca `Fn::ImportValue` para importar uma variável específica, essa variável deve ser definida como uma `Export Value` em todas as contas dos membros dessa organização.

Para AWS Config regras personalizadas, consulte Como gerenciar centralmente AWS Config as regras em vários Contas da AWS blogs para configurar as permissões adequadas.

Política de bucket da organização:

AWS Config Para poder armazenar artefatos do pacote de conformidade, você precisará fornecer um bucket do Amazon S3 e adicionar as seguintes permissões. Para obter mais informações sobre como nomear seu bucket, consulte Regras de nomeação de bucket.

AWS Config Verificações de processo em um pacote de conformidade para AWS Config

As verificações de processo são um tipo de AWS Config regra que permite rastrear suas tarefas externas e internas que exigem verificação como parte dos pacotes de conformidade. Essas verificações podem ser adicionadas a um pacote de conformidade existente ou a um novo pacote de conformidade. Você pode monitorar toda a conformidade, incluindo AWS Config prazos e verificações manuais, em um único local.

Com as verificações de processo, você pode listar a conformidade dos requisitos e ações em um único local. Essas verificações de processo ajudam a aumentar a cobertura dos pacotes de conformidade baseados em regimes de conformidade. Você pode expandir ainda mais o pacote de conformidade adicionando novas verificações de processo que rastreiam processos e ações que precisam de verificação e rastreamento manuais. Isso permite que o pacote de conformidade se torne o modelo que fornece detalhes sobre AWS Config prazos e processos manuais para um regime de conformidade.

Você pode rastrear e gerenciar a conformidade de processos não associados às alterações de configuração de recursos em um pacote de conformidade como verificações de processos. Por exemplo, você pode adicionar uma verificação de processo para rastrear o requisito de conformidade do PCI-DSS para armazenar o backup de mídia em um local externo. Você avaliará manualmente a conformidade disso de acordo com as diretrizes do PCI-DSS ou de acordo com as orientações da sua organização.

Disponibilidade regional: as verificações de processo com os pacotes de conformidade estão disponíveis em todos os Regiões da AWS lugares em que os pacotes de AWS Config conformidade estão disponíveis. Para obter mais informações, consulte Suporte regional.

```

Veja dois modelos de exemplo, o modelo Melhores práticas operacionais para o CIS AWS Foundations Benchmark v1.4 Level 1 e o modelo Melhores práticas operacionais para o CIS AWS Foundations Benchmark v1.4 Level 2.

Inclua verificações de processo em um pacote de conformidade

1. Adicione uma verificação de processo no modelo do pacote de conformidade. Consulte Exemplo de modelo de pacote de conformidade para criar verificações de processo.

   ```
   Resources:
     ConfigEnabledAllRegions:
       Properties:
         ConfigRuleName: Config-Enabled-All-Regions
         Description: Ensure AWS Config is enabled in all Regions.

           Owner: AWS
   ```

```
        SourceIdentifier: AWS_CONFIG_PROCESS_CHECK
    Type: AWS::Config::ConfigRule
```

2. Insira o nome da verificação do processo.
3. Insira a descrição da verificação do processo.
4. Implante o pacote de conformidade. Para obter mais informações, consulte Implantar pacotes de conformidade para o AWS Config.

Alterar o status de conformidade de uma verificação de processo

Você pode alterar o status de conformidade de uma verificação de processo usando o AWS Config console AWS CLI, o APIs e.

Change Compliance Status for Process Checks (Console)

1. Faça login no Console de gerenciamento da AWS e abra o AWS Config console em https://console.aws.amazon.com/config/casa.
2. Navegue até a página AWS Config Regras.
3. Escolha o nome da verificação do processo que você especificou no modelo junto com o identificador no pacote de conformidade.

   > **Note**
   >
   > Todas as verificações de processo do mesmo pacote de conformidade têm o mesmo sufixo.

4. Na página Detalhes da regra, você não pode editar a regra, mas pode editar a conformidade da regra. Na seção Conformidade manual, escolha Editar conformidade.
5. Escolha a conformidade apropriada na lista suspensa.
6. (Opcional) Insira uma descrição para o status de conformidade.
7. Escolha Salvar.

Change the Compliance Status for Process Checks (AWS CLI)

Você pode atualizar a conformidade das verificações do processo em um pacote de conformidade usando o AWS Command Line Interface ()AWS CLI.

Para instalar o AWS CLI em sua máquina local, consulte Instalando o AWS CLI no Guia AWS CLI do Usuário.

Se necessário, digite `AWS Config ure` para configurar o AWS CLI para usar uma AWS região onde os pacotes de AWS Config conformidade estejam disponíveis.

1. Abra um prompt de comando ou uma janela do terminal.
2. Insira o comando a seguir para atualizar a conformidade de uma verificação de processo, no qual o `ComplianceResourceId` é o `Account ID` e inclua o nome da sua regra.

```
aws configservice put-external-evaluation --config-rule-
name process-check-rule-name  --external-evaluation
 ComplianceResourceType=AWS::::Account,ComplianceResourceId=Account
 ID,ComplianceType=NON_COMPLIANT,OrderingTimestamp=2020-12-17T00:10:00.000Z
```

3. Pressione Enter para executar o comando.

Change the Compliance Status for Process Checks (API)

Depois que a implantação for concluída, para atualizar as avaliações e a conformidade das verificações do processo, use a API `PutExternalEvaluation`. Para obter mais informações, consulte PutExternalEvaluation.

Exibir e editar a verificação do processo (console)

Você pode visualizar as verificações do processo somente depois que um estado de conformidade for adicionado às verificações do processo. Escolha o pacote de conformidade específico para visualizar todas as verificações de processo dentro desse pacote de conformidade. Aqui você pode ver uma lista de verificações de processo que estão em conformidade e não conformidade.

Como essa é uma regra vinculada ao serviço, você não pode editar a verificação do processo na página de detalhes da regra.

> **Note**
>
> No entanto, você pode atualizar a conformidade da verificação do processo escolhendo Editar conformidade e selecionando o valor apropriado entre Compatível, não compatível ou não aplicável.

Você pode editar ou excluir uma verificação de processo do pacote de conformidade em que você adicionou as verificações de processo.

Modelos de amostra de pacotes de conformidade para AWS Config

Aqui estão os modelos YAML do pacote de conformidade que você vê no console. AWS Config Em cada modelo de pacote de conformidade, você pode usar uma ou mais AWS Config regras e ações de remediação. As AWS Config regras listadas no pacote de conformidade podem ser regras AWS Config gerenciadas e regras and/or AWS Config personalizadas. Você pode baixar todos os modelos de pacotes de conformidade em. GitHub

> **Important**
>
> Os pacotes de conformidade fornecem uma estrutura de conformidade de uso geral para ajudá-lo a criar verificações de governança de segurança, operação ou otimização de custos usando regras e ações de remediação gerenciadas ou personalizadas. AWS Config AWS Config AWS os modelos de amostra de pacotes de conformidade pretendem ajudá-lo a criar seus próprios pacotes de conformidade com regras diferentes ou adicionais, parâmetros de entrada e ações de remediação adequadas ao seu ambiente. Os modelos de exemplo, incluindo aqueles relacionados a padrões de conformidade e benchmarks do setor, não foram projetados para garantir sua conformidade com um padrão de governança específico. Eles não podem substituir seus esforços internos nem garantir que você passará em uma avaliação de conformidade.

> **Note**
>
> É recomendável que você revise as regras disponíveis na região em que você implanta um pacote de conformidade (Lista de regras AWS Config gerenciadas por disponibilidade regional) e altere o modelo das regras que ainda não estão disponíveis nessa região antes da implantação.

AWS Pacote de conformidade Control Tower Detective Guardrails

Este pacote de conformidade contém AWS Config regras baseadas nas grades de proteção do AWS Control Tower Detective. Para obter uma lista de todas as regras gerenciadas suportadas pelo AWS Config, consulte Lista de regras AWS Config gerenciadas.

Consulte a seção `Parameters` no modelo a seguir para obter os nomes e as descrições dos parâmetros necessários.

O modelo está disponível em GitHub: AWS Control Tower Detective Guardrails Conformance Pack.

Práticas recomendadas de resiliência cibernética para o Amazon S3, Amazon EBS e Amazon DynamoDB

Esse pacote de conformidade contém AWS Config regras baseadas nas melhores práticas de resiliência cibernética para Amazon S3, Amazon EBS e Amazon DynamoDB. Para obter uma lista de todas as regras gerenciadas suportadas pelo AWS Config, consulte Lista de regras AWS Config gerenciadas.

Consulte a seção `Parameters` no modelo a seguir para obter os nomes e as descrições dos parâmetros necessários.

O modelo está disponível em GitHub: Melhores práticas de resiliência cibernética para Amazon S3, Amazon EBS e Amazon DynamoDB.

Práticas operacionais recomendadas para workloads de materiais do CCIG 2.0 da ABS

Os pacotes de conformidade fornecem uma estrutura de conformidade de uso geral projetada para permitir que você crie verificações de governança de segurança, operação ou otimização de custos usando regras e ações de remediação gerenciadas ou personalizadas. AWS Config AWS Config Os pacotes de conformidade, como os modelos de amostra, não foram projetados para garantir totalmente a conformidade com um padrão específico de governança ou conformidade. Você é responsável por avaliar se o seu uso dos serviços atende aos requisitos legais e regulamentares aplicáveis.

A seguir, é apresentado um exemplo de mapeamento entre o Guia de Implementação de Computação em Nuvem do ABS 2.0 - Cargas de trabalho de materiais e regras de configuração AWS gerenciadas. Cada regra do Config se aplica a um AWS recurso específico e está relacionada a um ou mais controles do Guia de Implementação de Computação em Nuvem do ABS. Um controle do Guia de implementação de computação em nuvem da ABS pode estar relacionado a várias regras do Config. Consulte a tabela abaixo para conferir mais detalhes e orientações relacionados a esses mapeamentos.

ID de controle	AWS Regra de configuração	Orientação
seção 4 a-govern-the-cloud - 2 - cargas de trabalho de materiais	guardduty-enabled-centralized	A Amazon GuardDuty pode ajudar a monitorar e detectar possíveis eventos de cibersegurança usando feeds de inteligência de ameaças. Isso inclui listas de aprendiza do de máquina IPs e malicioso para identificar atividades inesperadas, não autorizadas

seção 4 a-govern-the-cloud - 2 - cargas de trabalho de materiais	securityhub-enabled	AWS O Security Hub ajuda a monitorar pessoas, conexões, dispositivos e software não autorizados. AWS O Security Hub agrega, organiza e prioriza os alertas ou descobertas de segurança de vários serviços. AWS Alguns desses serviços são o Amazon Security Hub, o Amazon Inspector, o Amazon Macie AWS , o Identity and Access Management (IAM) Access Analyzer e o Firewall AWS Manager, além de soluções de parceiros. AWS
seção 4 a-govern-the-cloud - 2 - cargas de trabalho padrão	account-part-of-organizations	O gerenciamento centralizado de Contas da AWS dentro das AWS Organizations ajuda a garantir que as contas estejam em conformidade. Usar uma governança não centralizada na conta pode gerar inconsist ências nas configurações da conta, o que pode expor recursos e dados confidenc iais.

seção 4 a-govern-the-cloud - 2 - cargas de trabalho padrão	cloudtrail-security-trail-enabled	Essa regra ajuda a garantir o uso das melhores práticas de segurança AWS recomendadas para AWS CloudTrail, verificando a ativação de várias configurações. Isso inclui o uso de criptografia de registros, validação de registros e habilitação AWS CloudTrail em várias regiões.

seção 4 a-govern-the-cloud - 2 - cargas de trabalho padrão	cloudwatch-alarm-action-check	CloudWatch Os alarmes da Amazon alertam quando uma métrica ultrapassa o limite de um número específico de períodos de avaliação. O alarme executa uma ou mais ações com base no valor da métrica ou na expressão em relação a um limite em alguns períodos. Essa regra exige um valor para alarmActionRequired (Config Default: True), insufficientDataAction Obrigatório (Config Default: True), (okActionRequired Config Default: False). O valor real deve refletir as ações de alarme do ambiente.
seção 4 a-govern-the-cloud - 2 - cargas de trabalho padrão	cloud-trail-cloud-watch-logs-habilitado	Use CloudWatch a Amazon para coletar e gerenciar centralmente a atividade de eventos de log. A inclusão de AWS CloudTrail dados fornece detalhes da atividade de chamadas de API em seu Conta da AWS.

A CRR permite a cópia automática e assíncrona de objetos nos buckets do Amazon S3 para ajudar a garantir a manutenção da disponibilidade de dados.
seção 4 b-design-and-secure - as cargas de trabalho padrão da nuvem 3	autoscaling-group-elb-healt hcheck-obrigatório	As verificações de integrida de do Elastic Load Balancer (ELB) para grupos do Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling contribuem para a manutençã o de níveis adequados de capacidade e disponibilidade. O balanceador de carga periodicamente envia pings, faz tentativas de conexão ou envia solicitações para testar a integridade de instância s do Amazon EC2 em um grupo de ajuste de escala automático. Se uma instância não estiver respondendo, o tráfego será enviado para uma nova instância do Amazon EC2.

seção 4 c-run-the-cloud - 3 - cargas de trabalho padrão	cloudwatch-alarm-action-check	CloudWatch Os alarmes da Amazon alertam quando uma métrica ultrapassa o limite de um número específico de períodos de avaliação. O alarme executa uma ou mais ações com base no valor da métrica ou na expressão em relação a um limite em alguns períodos. Essa regra exige um valor para alarmActionRequired (Config Default: True), insufficientDataAction Obrigatório (Config Default: True), (okActionRequired Config Default: False). O valor real deve refletir as ações de alarme do ambiente.
seção 4 c-run-the-cloud - 3 - cargas de trabalho padrão	cloud-trail-cloud-watch-logs-habilitado	Use CloudWatch a Amazon para coletar e gerenciar centralmente a atividade de eventos de log. A inclusão de AWS CloudTrail dados fornece detalhes da atividade de chamadas de API em seu Conta da AWS.

seção 4 c-run-the-cloud - 3 - cargas de trabalho padrão	cloudtrail-enabled	AWS CloudTrail pode ajudar na não repúdio gravando ações do AWS Managemen t Console e chamadas de API. Você pode identificar os usuários e os Contas da AWS que chamaram um AWS serviço, o endereço IP de origem onde as chamadas foram geradas e os horários das chamadas. Os detalhes dos dados capturados são vistos no Conteúdo do AWS CloudTrail Registro.
seção 4 c-run-the-cloud - 3 - cargas de trabalho padrão	cloud-trail-encryption-enabled	Como pode haver dados confidenciais e para ajudar a proteger os dados em repouso, habilite a criptogra fia para as trilhas do AWS CloudTrail.

seção 4 c-run-the-cloud - 3 - cargas de trabalho padrão	cloud-trail-log-file-habilitado para validação	Utilize a validação do arquivo de AWS CloudTrail log para verificar a integridade dos CloudTrail registros. A validação do arquivo de log ajuda a determinar se um arquivo de log foi modificado, excluído ou inalterado após a CloudTrail entrega. Esse recurso é criado usando algoritmos padrão do setor: SHA-256 para hashing e SHA-256 com RSA para assinaturas digitais. Isso torna computacionalmente inviável modificar, excluir ou CloudTrail falsificar arquivos de log sem detecção.
seção 4 c-run-the-cloud - 3 - cargas de trabalho padrão	elasticsearch-logs-to-cloudwatch	Certifique-se de que os domínios do Amazon OpenSearch Service tenham registros de erros habilitados e transmitidos para o Amazon CloudWatch Logs para retenção e resposta. Os logs de erros do domínio podem auxiliar nas auditorias de segurança e acesso, além de ajudar a diagnosticar problemas de disponibilidade.

CloudTrail entregará arquivos de log de todas as AWS regiões para seu bucket do S3 se MULTI_REGION_CLOUD _TRAIL_ENABLED estiver habilitado. Além disso, ao AWS lançar uma nova região, CloudTrail criará a mesma trilha na nova região. Como resultado, você receberá arquivos de log contendo a atividade da API para a nova região sem realizar nenhuma ação.

Os pacotes de conformidade fornecem uma estrutura de conformidade de uso geral projetada para permitir que você crie verificações de governança de segurança, operação ou otimização de custos usando regras e ações de remediação gerenciadas ou personalizadas. AWS Config AWS Config Os pacotes de conformidade, como os modelos de amostra, não foram projetados para garantir totalmente a conformidade com um padrão específico de governança ou conformidade. Você é responsável por avaliar se o seu uso dos serviços atende aos requisitos legais e regulamentares aplicáveis.

A seguir, é apresentado um exemplo de mapeamento entre o Guia de Implementação de Computação em Nuvem do ABS 2.0 - Cargas de trabalho padrão e regras de configuração AWS gerenciadas. Cada regra do Config se aplica a um AWS recurso específico e está relacionada a um ou mais controles do Guia de Implementação de Computação em Nuvem do ABS. Um controle do Guia de implementação de computação em nuvem da ABS pode estar relacionado a várias regras do Config. seção 4 c-run-the-cloud - 3 - cargas de trabalho padrão	api-gw-execution-logging-habilitado	O registro em log do API Gateway exibe visualizações detalhadas dos usuários que acessaram a API e a forma como eles a acessaram. Esse insight mostra as atividades do usuário.
seção 4 c-run-the-cloud - 3 - cargas de trabalho padrão	cloudtrail-s3-dataevents-enabled	A coleta de eventos de dados do Simple Storage Service (Amazon S3) ajuda a detectar qualquer atividade anômala. Os detalhes incluem informações da conta da AWS que acessou um bucket do Amazon S3, o endereço IP e o horário do evento.
seção 4 c-run-the-cloud - 3 - cargas de trabalho padrão	cloudtrail-security-trail-enabled	Essa regra ajuda a garantir o uso das melhores práticas de segurança AWS recomendadas para AWS CloudTrail, verificando a ativação de várias configurações. Isso inclui o uso de criptografia de registros, validação de registros e habilitação AWS CloudTrail em várias regiões.

seção 4 c-run-the-cloud - 3 - cargas de trabalho padrão	cloudwatch-alarm-action-check	CloudWatch Os alarmes da Amazon alertam quando uma métrica ultrapassa o limite de um número específico de períodos de avaliação. O alarme executa uma ou mais ações com base no valor da métrica ou na expressão em relação a um limite em alguns períodos. Essa regra exige um valor para alarmActionRequired (Config Default: True), insufficientDataAction Obrigatório (Config Default: True), (okActionRequired Config Default: False). O valor real deve refletir as ações de alarme do ambiente.
seção 4 c-run-the-cloud - 3 - cargas de trabalho padrão	cloud-trail-cloud-watch-logs-habilitado	Use CloudWatch a Amazon para coletar e gerenciar centralmente a atividade de eventos de log. A inclusão de AWS CloudTrail dados fornece detalhes da atividade de chamadas de API em seu Conta da AWS.

seção 4 c-run-the-cloud - 3 - cargas de trabalho padrão	cloudtrail-enabled	AWS CloudTrail pode ajudar na não repúdio gravando ações do AWS Managemen t Console e chamadas de API. Você pode identificar os usuários e os Contas da AWS que chamaram um AWS serviço, o endereço IP de origem onde as chamadas foram geradas e os horários das chamadas. Os detalhes dos dados capturados são vistos no Conteúdo do AWS CloudTrail Registro.
seção 4 c-run-the-cloud - 3 - cargas de trabalho padrão	cloud-trail-encryption-enabled	Como pode haver dados confidenciais e para ajudar a proteger os dados em repouso, habilite a criptogra fia para as trilhas do AWS CloudTrail.

ID de controle	AWS Regra de configuração	Orientação
seção 4 c-run-the-cloud - 3 - cargas de trabalho padrão	cloud-trail-log-file-habilitado para validação	Utilize a validação do arquivo de AWS CloudTrail log para verificar a integridade dos CloudTrail registros. A validação do arquivo de log ajuda a determinar se um arquivo de log foi modificado, excluído ou inalterado após a CloudTrail entrega. Esse recurso é criado usando algoritmos padrão do setor: SHA-256 para hashing e SHA-256 com RSA para assinaturas digitais. Isso torna computacionalmente inviável modificar, excluir ou CloudTrail falsificar arquivos de log sem detecção.
seção 4 c-run-the-cloud - 3 - cargas de trabalho padrão	elasticsearch-logs-to-cloudwatch	Certifique-se de que os domínios do Amazon OpenSearch Service tenham registros de erros habilitados e transmitidos para o Amazon CloudWatch Logs para retenção e resposta. Os logs de erros do domínio podem auxiliar nas auditorias de segurança e acesso, além de ajudar a diagnosticar problemas de disponibilidade.

seção 4 c-run-the-cloud - 3 - cargas de trabalho padrão	elb-logging-enabled	A atividade do Elastic Load Balancing é um ponto central de comunicação em um ambiente. Habilite o registro em log do ELB. Os dados coletados fornecem informaçõ es detalhadas sobre as solicitações enviadas ao ELB. Cada log contém informaçõ es como a hora em que a solicitação foi recebida, o endereço IP do cliente, latências, caminhos de solicitação e respostas do servidor.
seção 4 c-run-the-cloud - 3 - cargas de trabalho padrão	guardduty-enabled-centralized	A Amazon GuardDuty pode ajudar a monitorar e detectar possíveis eventos de cibersegurança usando feeds de inteligência de ameaças. Isso inclui listas de aprendiza do de máquina IPs e malicioso para identificar atividades inesperadas, não autorizadas e maliciosas em seu ambiente de AWS nuvem.

seção 4 c-run-the-cloud - 3 - cargas de trabalho padrão	multi-region-cloudtrail-enabled	AWS CloudTrail registra as ações do AWS Managemen t Console e as chamadas de API. Você pode identific ar quais usuários e contas ligaram AWS, o endereço IP de origem de onde as chamadas foram feitas e quando elas ocorreram. CloudTrail entregará arquivos de log de todas as AWS regiões para seu bucket do S3 se MULTI_REGION_CLOUD _TRAIL_ENABLED estiver habilitado. Além disso, ao AWS lançar uma nova região, CloudTrail criará a mesma trilha na nova região. Como resultado, você receberá arquivos de log contendo a atividade da API para a nova região sem realizar nenhuma ação.

seção 4 c-run-the-cloud - 3 - cargas de trabalho padrão	s3- bucket-logging-enabled	O registro em log de acesso ao servidor do Amazon Simple Storage Service (Amazon S3) fornece um método para monitorar a rede em busca de possíveis eventos de segurança cibernética. Os eventos são monitorados pela captura de registros detalhado s das solicitações que são feitas a um bucket do Amazon S3. Cada registro de log de acesso fornece detalhes sobre uma única solicitaç ão de acesso. Os detalhes incluem solicitante, nome do bucket, horário da solicitação, ação da solicitação, status da resposta e um código de erro, se relevante.

seção 4 c-run-the-cloud - 3 - cargas de trabalho padrão	wafv2-logging-enabled	Para ajudar com o registro e o monitoramento em seu ambiente, habilite o registro em AWS WAF (V2) na web regional e global. ACLs AWS O registro do WAF fornece informações detalhadas sobre o tráfego que é analisado pela sua ACL da web. Os registros registram a hora em que o AWS WAF recebeu a solicitação do seu AWS recurso, informações sobre a solicitação e uma ação para a regra à qual cada solicitação correspondeu.
seção 4 c-run-the-cloud - 3 - cargas de trabalho padrão	opensearch-audit-logging-enabled	Certifique-se de que o registro de auditoria esteja ativado em seus domínios OpenSearch do Amazon Service. O registro de auditoria permite que você acompanhe a atividade do usuário em seus OpenSearch domínios, incluindo sucessos e falhas de autenticação, solicitações, alterações de índice e consultas de pesquisa recebidas. seção 4 c-run-the-cloud - 5 - cargas de trabalho padrão	autoscaling-group-elb-healthcheck-obrigatório	As verificações de integridade do Elastic Load Balancer (ELB) para grupos do Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling contribuem para a manutenção de níveis adequados de capacidade e disponibilidade. O balanceador de carga periodicamente envia pings, faz tentativas de conexão ou envia solicitações para testar a integridade de instâncias do Amazon EC2 em um grupo de ajuste de escala automático. Se uma instância não estiver respondendo, o tráfego será enviado para uma nova instância do Amazon EC2.
seção 4 c-run-the-cloud - 5 - cargas de trabalho padrão	cloud-trail-cloud-watch-logs-habilitado	Use CloudWatch a Amazon para coletar e gerenciar centralmente a atividade de eventos de log. A inclusão de AWS CloudTrail dados fornece detalhes da atividade de chamadas de API em seu Conta da AWS.

seção 4 c-run-the-cloud - 5 - cargas de trabalho padrão	dynamodb-throughput-limit-check	Habilite essa regra para garantir que a capacidade de throughput provisionada seja verificada em suas tabelas do Amazon DynamoDB. Essa é a quantidade de read/write atividade que cada mesa pode suportar. O DynamoDB usa essas informações para reservar recursos suficientes do sistema para atender aos seus requisitos de throughput. Essa regra gera um alerta quando o throughput se aproxima do limite máximo da conta de um cliente. Essa regra permite que você defina opcionalmente os parâmetros RCUThreshold Porcentagem da conta (Configuração Padrão: 80) e Porcentagem WCUThreshold da conta (Padrão de Configuração: 80). Os valores reais devem refletir as políticas da organização.

Práticas recomendadas operacionais para o ACSC Essential 8

Os pacotes de conformidade fornecem uma estrutura de conformidade de uso geral projetada para permitir que você crie verificações de governança de segurança, operação ou otimização de custos usando regras e ações de remediação gerenciadas ou personalizadas. AWS Config AWS Config Os pacotes de conformidade, como os modelos de amostra, não foram projetados para garantir totalmente a conformidade com um padrão específico de governança ou conformidade. Você é responsável por avaliar se o seu uso dos serviços atende aos requisitos legais e regulamentares aplicáveis.

A seguir, é apresentado um exemplo de mapeamento entre o Modelo de Maturidade Essential Eight do Australian Cyber Security Centre (ACSC) e as regras AWS gerenciadas do Config. Cada regra do Config se aplica a um AWS recurso específico e está relacionada a um ou mais controles ACSC Essential Eight. Um controle do Essential Eight do ACSC pode estar relacionado a várias regras do Config. Consulte a tabela abaixo para conferir mais detalhes e orientações relacionados a esses mapeamentos. Alguns dos mapeamentos para regras de configuração são para a seção de ordem superior (por exemplo. Estratégias de mitigação para limitar a extensão dos incidentes de segurança cibernética), em oposição às seções mais prescritivas.

Application_control	alb-waf-enabled	Certifique-se de que o AWS WAF esteja ativado nos Elastic Load Balancers (ELB) para ajudar a proteger aplicativos da web. Um WAF ajuda a proteger seus aplicativos da web ou APIs contra explorações comuns da web. Essas exploraçõ es da web podem afetar a disponibilidade, compromet er a segurança ou consumir recursos excessivos em seu ambiente.
Application_control	api-gw-associated-with-onda	AWS O WAF permite que você configure um conjunto de regras (chamado de lista de controle de acesso à web (Web ACL)) que permite, bloqueia ou conta solicitações da web com base nas regras e condições de segurança da web personalizáveis que você define. Associe seu estágio do Amazon API Gateway a uma ACL da web do WAF para protegê-lo contra ataques mal-intencionados.

Restrict_administrative_privileges	ecs-containers-nonprivileged	Para ajudar na implementação do princípio de privilégio mínimo, as definições de tarefas do Amazon Elastic Container Service (Amazon ECS) não devem ter o privilégio elevado habilitado. Quando esse parâmetro é verdadeiro, o contêiner recebe privilégios elevados na instância de contêiner host (semelhante ao usuário raiz).
Restrict_administrative_privileges	ecs-containers-readonly-access	Habilitar o acesso somente de leitura aos contêineres do Amazon Elastic Container Service (ECS) pode ajudar a aderir à entidade principal de privilégio mínimo. Essa opção pode reduzir os vetores de ataque, pois o sistema de arquivos da instância do contêiner não pode ser modificado, a menos que tenha permissões explícitas de leitura e gravação.
Restrict_administrative_privileges	ecs-task-definition-nonroot-usuário	Para ajudar na implementação do princípio de privilégio mínimo, garanta que um usuário não raiz seja designado para acessar suas definições de tarefas do Amazon Elastic Container Service (Amazon ECS).

36d	access-keys-rotated	As credenciais são auditadas para dispositivos, usuários e processos autorizados garantindo que as chaves de acesso do IAM sejam alternadas como especificado pela política organizacional. Alterar as chaves de acesso regularmente é uma prática recomendada de segurança . Isso reduz o período em que uma chave de acesso permanece ativa e diminui o impacto nos negócios se as chaves forem comprometidas. 36d	emr-kerberos-enabled	Ao habilitar o Kerberos para clusters do Amazon EMR, é possível gerenciar e incorporar as permissões e autorizações de acesso com os princípios de privilégio mínimo e separação de deveres. No Kerberos, os serviços e os usuários que precisam se autenticar são conhecidos como entidades principais. As entidades principais existem em um realm Kerberos. No realm, um servidor Kerberos é conhecido como o centro de distribuição de chaves (KDC). Ele fornece um meio para as entidades principais se autenticarem. A autenticação do KDC é feita com a emissão de tíquetes. O KDC mantém um banco de dados das entidades principais no realm, as senhas e outras informações administrativas sobre cada entidade principal.

36j	cloudwatch-alarm-action-check	CloudWatch Os alarmes da Amazon alertam quando uma métrica ultrapassa o limite de um número específico de períodos de avaliação. O alarme executa uma ou mais ações com base no valor da métrica ou na expressão em relação a um limite em alguns períodos. Essa regra exige um valor para alarmActionRequired (Config Default: True), insufficientDataAction Obrigatório (Config Default: True), (okActionRequired Config Default: False). O valor real deve refletir as ações de alarme do ambiente.

36j	dynamodb-throughput-limit-check	Habilite essa regra para garantir que a capacidade de throughput provisionada seja verificada em suas tabelas do Amazon DynamoDB. Essa é a quantidade de read/write atividade que cada mesa pode suportar. O DynamoDB usa essas informações para reservar recursos suficientes do sistema para atender aos seus requisitos de throughput. Essa regra gera um alerta quando o throughput se aproxima do limite máximo da conta de um cliente. Essa regra permite que você defina opcionalmente os parâmetros RCUThreshold Porcentagem da conta (Configuração Padrão: 80) e Porcentagem WCUThreshold da conta (Padrão de Configuração: 80). Os valores reais devem refletir as políticas da organização.

Melhores práticas operacionais para o pilar de confiabilidade do AWS Well-Architected Framework

Os pacotes de conformidade fornecem uma estrutura de conformidade de uso geral projetada para permitir que você crie verificações de governança de segurança, operação ou otimização de custos usando regras e ações de remediação gerenciadas ou personalizadas. AWS Config AWS Config Os pacotes de conformidade, como os modelos de amostra, não foram projetados para garantir totalmente a conformidade com um padrão específico de governança ou conformidade. Você é responsável por avaliar se o seu uso dos serviços atende aos requisitos legais e regulamentares aplicáveis.

A seguir, é apresentado um exemplo de mapeamento entre o pilar de confiabilidade do Well-Architected Framework da Amazon Web Services e as regras de configuração gerenciadas. AWS Cada regra do Config se aplica a um AWS recurso específico e está relacionada a um ou mais dos princípios de design do pilar. Uma categoria do Well-Architected Framework pode estar relacionada a várias regras do Config. Consulte a tabela abaixo para conferir mais detalhes e orientações relacionados a esses mapeamentos.

ACLs AWS O registro do WAF fornece informações detalhadas sobre o tráfego que é analisado pela sua ACL da web. Os registros registram a hora em que o AWS WAF recebeu a solicitação do seu AWS recurso, informações sobre a solicitação e uma ação para a regra à qual cada solicitação correspondeu.

REL-7	Como você projeta a workload para se adaptar às alterações na demanda? Uma workload escalável fornece elasticidade para adicionar ou remover recursos automaticamente, de modo que eles correspondam perfeitamente à demanda atual em determinado momento.	dynamodb-autoscaling-enabled	O Amazon DynamoDB auto scaling usa o serviço Application AWS Auto Scaling para ajustar a capacidade de transferência provisionada que responde automaticamente aos padrões reais de tráfego. Isso permite que uma tabela ou um índice secundário global aumente sua read/write capacidade provisionada para lidar com aumentos repentinos no tráfego, sem limitação.

O balanceador de carga periodicamente envia pings, faz tentativas de conexão ou envia solicitações para testar a integridade de instâncias do Amazon EC2 em um grupo de ajuste de escala automático. Se uma instância não estiver respondendo, o tráfego será enviado para uma nova instância do Amazon EC2.

Melhores práticas operacionais para o pilar de segurança do AWS Well-Architected Framework

Os pacotes de conformidade fornecem uma estrutura de conformidade de uso geral projetada para permitir que você crie verificações de governança de segurança, operação ou otimização de custos usando regras e ações de remediação gerenciadas ou personalizadas. AWS Config AWS Config Os pacotes de conformidade, como os modelos de amostra, não foram projetados para garantir totalmente a conformidade com um padrão específico de governança ou conformidade. Você é responsável por avaliar se o seu uso dos serviços atende aos requisitos legais e regulamentares aplicáveis.

A seguir, é apresentado um exemplo de mapeamento entre o pilar de segurança do Well-Architected Framework da Amazon Web Services e as regras de configuração gerenciadas. AWS Cada regra do Config se aplica a um AWS recurso específico e está relacionada a um ou mais dos princípios de design do pilar. Uma categoria do Well-Architected Framework pode estar relacionada a várias regras do Config. Consulte a tabela abaixo para conferir mais detalhes e orientações relacionados a esses mapeamentos.

10,61	Uma instituição financeira deve garantir que sistemas críticos não sejam executados em sistemas desatualizados com vulnerabilidades de segurança conhecidas ou sistemas de tecnologia end-of-life (EOL). Nesse sentido, uma instituição financeira deve atribuir claramente responsabilidades às funções identificadas: (a) monitorar continuamente e implementar os lançamentos de patches mais recentes em tempo hábil; e (b) identificar sistemas tecnológicos críticos que estão se aproximando do fim da vida útil para obter mais medidas corretivas.	redshift-cluster-maintenancesettings-check	Essa regra garante que os clusters do Amazon Redshift tenham as configurações preferidas da organização. Especificamente, que eles tenham janelas de manutenção preferenciais e períodos automatizados de retenção de instantâneos para o banco de dados. Essa regra exige que você defina allowVersionUpgrade o. O padrão é true. Também permite definir opcionalmente o preferredMaintenanceWindow (o padrão é sat: 16:00 -sat: 16:30) e o automatedSnapshotRetentionPeríodo (o padrão é 1). Os valores reais devem refletir as políticas da organização.
